complementary binding is due to the fact that the nucleotide sequence of VGAM823 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM823 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11483] The complementary binding of VGAM823 RNA, herein designated VGAM RNA, to host target binding sites on VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM823 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM823 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11484] It is appreciated that VGAM823 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM823 host target genes. The mRNA of each one of this plurality of VGAM823 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM823 RNA, herein designated VGAM RNA, and which when bound by VGAM823 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM823 host target proteins.

[11485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM823 gene, herein designated VGAM GENE, on one or more VGAM823 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11486] It is yet further appreciated that a function of VGAM823 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM823 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM823 correlate with, and may be deduced from, the identity of the host target genes which VGAM823 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11487] Nucleotide sequences of the VGAM823 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM823 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM823 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM823 are further described hereinbelow with reference to Table 1.

[11488] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM823 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11489] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 824 (VGAM824) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11490] VGAM824 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM824 was detected is described hereinabove with reference to Figs. 2-8.

[11491] VGAM824 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[11492] VGAM824 gene, herein designated VGAM GENE, encodes a VGAM824 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM824 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM824 precursor RNA is designated SEQ ID:810, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:810 is located at position 3473 relative to the genome of African swine fever virus.

[11493] VGAM824 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11494] An enzyme complex designated DICER COMPLEX, dices

the VGAM824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM824 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM824 RNA is designated SEQ ID:3535, and is provided hereinbelow with reference to the sequence listing part.

[11495] VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11496] VGAM824 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM824 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM824 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM824 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11497] The complementary binding of VGAM824 RNA, herein designated VGAM RNA, to host target binding sites on VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM824 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM824 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11498] It is appreciated that VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM824 host target genes. The mRNA of each one of this plurality of VGAM824 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM824 RNA, herein designated VGAM RNA, and which when bound by VGAM824 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM824 host target proteins.

[11499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM824 gene, herein designated VGAM GENE, on one or more VGAM824 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11500] It is yet further appreciated that a function of VGAM824 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM824 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM824 correlate with, and may be deduced from, the identity of the host target genes which VGAM824 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11501] Nucleotide sequences of the VGAM824 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM824 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM824 are further described hereinbelow with reference to Table 1.

[11502] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM824 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11503] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 825 (VGAM825) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11504] VGAM825 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM825 was detected is described hereinabove with reference to Figs. 2-8.

[11505] VGAM825 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM825 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[11506] VGAM825 gene, herein designated VGAM GENE, encodes a VGAM825 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM825 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM825 precursor RNA is designated SEQ ID:811, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:811 is located at position 80642 relative to the genome of Monkeypox virus.

[11507] VGAM825 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11508] An enzyme complex designated DICER COMPLEX, dices the VGAM825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM825 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM825 RNA is designated SEQ ID:3536, and is provided hereinbelow with reference to the sequence listing part.

[11509] VGAM825 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11510] VGAM825 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM825 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM825 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11511] The complementary binding of VGAM825 RNA, herein designated VGAM RNA, to host target binding sites on VGAM825 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM825 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM825 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11512] It is appreciated that VGAM825 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM825 host target genes. The mRNA of each one of this plurality of VGAM825 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM825 RNA, herein designated VGAM RNA, and which when bound by VGAM825 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM825 host target proteins.

[11513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM825 gene, herein designated VGAM GENE, on one or more VGAM825 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11514] It is yet further appreciated that a function of VGAM825 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM825 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM825 correlate with, and may be deduced from, the identity of the host target genes which VGAM825 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11515] Nucleotide sequences of the VGAM825 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM825 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM825 are further described hereinbelow with reference to Table 1.

[11516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM825 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11517] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 826 (VGAM826) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11518] VGAM826 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM826 was detected is described hereinabove with reference to Figs. 2-8.

[11519] VGAM826 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4.

VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11520] VGAM826 gene, herein designated VGAM GENE, encodes a VGAM826 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM826 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM826 precursor RNA is designated SEQ ID:812, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:812 is located at position 92205 relative to the genome of Bovine herpesvirus 4.

[11521] VGAM826 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[11522] An enzyme complex designated DICER COMPLEX, dices the VGAM826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM826 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM826 RNA is designated SEQ ID:3537, and is provided hereinbelow with reference to the sequence listing part.

[11523] VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11524] VGAM826 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM826 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM826 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11525] The complementary binding of VGAM826 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM826 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM826 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11526] It is appreciated that VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM826 host target genes. The mRNA of each one of this plurality of VGAM826 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM826 RNA, herein designated VGAM RNA, and which when bound by VGAM826 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM826 host target proteins.

[11527] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM826 gene, herein designated VGAM GENE, on one or more VGAM826 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11528] It is yet further appreciated that a function of VGAM826 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM826 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM826 correlate with, and may be deduced from, the identity of the host target genes which VGAM826 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11529] Nucleotide sequences of the VGAM826 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM826 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM826 are further described hereinbelow with reference to Table 1.

[11530] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM826 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11531] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 827 (VGAM827) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11532] VGAM827 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM827 was detected is described hereinabove with reference to Figs. 2-8.

[11533] VGAM827 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Bovine herpesvirus 4. VGAM827 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11534] VGAM827 gene, herein designated VGAM GENE, encodes a VGAM827 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM827 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM827 precursor RNA is designated SEQ ID:813, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:813 is located at position 90686 relative to the genome of Bovine herpesvirus 4.

[11535] VGAM827 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11536] An enzyme complex designated DICER COMPLEX, dices the VGAM827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM827 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM827 RNA is designated SEQ ID:3538, and is provided hereinbelow with reference to the sequence listing part.

[11537] VGAM827 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11538] VGAM827 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM827 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM827 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11539] The complementary binding of VGAM827 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM827 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM827 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11540] It is appreciated that VGAM827 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM827 host target genes. The mRNA of each one of this plurality of VGAM827 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM827 RNA, herein designated VGAM RNA, and which when bound by VGAM827 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM827 host target proteins.

[11541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM827 gene, herein designated VGAM GENE, on one or more VGAM827 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11542] It is yet further appreciated that a function of VGAM827 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM827 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM827 correlate with, and may be deduced from, the identity of the host target genes which VGAM827 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11543] Nucleotide sequences of the VGAM827 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM827 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM827 are further described hereinbelow with reference to Table 1.

[11544] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM827 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11545] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 828 (VGAM828) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11546] VGAM828 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM828 was detected is described hereinabove with reference to Figs. 2-8.

[11547] VGAM828 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11548] VGAM828 gene, herein designated VGAM GENE, encodes a VGAM828 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM828 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM828 precursor RNA is designated SEQ ID:814, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:814 is located at position 13516 relative to the genome of African swine fever virus.

[11549] VGAM828 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11550] An enzyme complex designated DICER COMPLEX, dices the VGAM828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM828 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM828 RNA is designated SEQ ID:3539, and is provided hereinbelow with reference to the sequence listing part.

[11551] VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[11552] VGAM828 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM828 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM828 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11553] The complementary binding of VGAM828 RNA, herein designated VGAM RNA, to host target binding sites on VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM828 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM828 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11554] It is appreciated that VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM828 host target genes. The mRNA of each one of this plurality of VGAM828 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM828 RNA, herein designated VGAM RNA, and which when bound by VGAM828 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM828 host target proteins.

[11555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM828 gene, herein designated VGAM GENE, on one or

more VGAM828 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11556] It is yet further appreciated that a function of VGAM828 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM828 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM828 correlate with, and may be deduced from, the identity of the host target genes which VGAM828 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11557] Nucleotide sequences of the VGAM828 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM828 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM828 are further described hereinbelow with reference to Table 1.

[11558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM828 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11559] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 829 (VGAM829) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11560] VGAM829 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM829 was detected is described

hereinabove with reference to Figs. 2–8.

[11561] VGAM829 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM829 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11562] VGAM829 gene, herein designated VGAM GENE, encodes a VGAM829 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM829 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM829 precursor RNA is designated SEQ ID:815, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:815 is located at position 13995 relative to the genome of African swine fever virus.

[11563] VGAM829 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11564] An enzyme complex designated DICER COMPLEX, dices the VGAM829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM829 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM829 RNA is designated SEQ ID:3540, and is provided hereinbelow with reference to the sequence listing part.

[11565] VGAM829 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11566] VGAM829 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM829 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM829 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3'UTR and 5'UTR regions.

[11567] The complementary binding of VGAM829 RNA, herein designated VGAM RNA, to host target binding sites on VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM829 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM829 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11568] It is appreciated that VGAM829 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM829 host target genes. The mRNA of each one of this plurality of VGAM829 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM829 RNA, herein designated VGAM RNA, and which when bound by VGAM829 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM829 host target proteins.

[11569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM829 gene, herein designated VGAM GENE, on one or more VGAM829 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11570] It is yet further appreciated that a function of VGAM829 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM829 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM829 correlate with, and may be deduced from, the identity of the host target genes which VGAM829 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[11571] Nucleotide sequences of the VGAM829 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM829 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM829 are further described hereinbelow with reference to Table 1.

[11572] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM829 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11573] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 830 (VGAM830) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11574] VGAM830 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM830 was detected is described hereinabove with reference to Figs. 2–8.

[11575] VGAM830 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM830 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11576] VGAM830 gene, herein designated VGAM GENE, encodes a VGAM830 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM830 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM830 precursor RNA is designated SEQ ID:816, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:816 is located at position 11737 relative to the genome of African swine fever virus.

[11577] VGAM830 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11578] An enzyme complex designated DICER COMPLEX, dices the VGAM830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM830 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM830 RNA is designated SEQ ID:3541, and is provided hereinbelow with reference to the sequence listing part.

[11579] VGAM830 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11580] VGAM830 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM830 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM830 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11581] The complementary binding of VGAM830 RNA, herein designated VGAM RNA, to host target binding sites on VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM830 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM830 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11582] It is appreciated that VGAM830 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM830 host target genes. The mRNA of each one of this plurality of VGAM830 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM830 RNA, herein designated VGAM RNA, and which when bound by VGAM830 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM830 host target proteins.

[11583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM830 gene, herein designated VGAM GENE, on one or more VGAM830 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11584] It is yet further appreciated that a function of VGAM830 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM830 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM830 correlate with, and may be deduced from, the identity of the host target genes which VGAM830 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[11585] Nucleotide sequences of the VGAM830 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM830 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM830 are further described hereinbelow with reference to Table 1.

[11586] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM830 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11587] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 831 (VGAM831) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11588] VGAM831 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM831 was detected is described hereinabove with reference to Figs. 2–8.

[11589] VGAM831 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM831 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11590] VGAM831 gene, herein designated VGAM GENE, encodes a VGAM831 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM831 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM831 precursor RNA is designated SEQ ID:817, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:817 is located at position 53746 relative to the genome of Human herpesvirus 6B.

[11591] VGAM831 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11592] An enzyme complex designated DICER COMPLEX, dices the VGAM831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM831 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM831 RNA is designated SEQ ID:3542, and is provided hereinbelow with reference to the sequence listing part.

[11593] VGAM831 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11594] VGAM831 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM831 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM831 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11595] The complementary binding of VGAM831 RNA, herein designated VGAM RNA, to host target binding sites on VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM831 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM831 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11596] It is appreciated that VGAM831 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM831 host target genes. The mRNA of each one of this plurality of VGAM831 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM831 RNA, herein designated VGAM RNA, and which when bound by VGAM831 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM831 host target proteins.

[11597] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM831 gene, herein designated VGAM GENE, on one or more VGAM831 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11598] It is yet further appreciated that a function of VGAM831 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM831 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM831 correlate with, and may be deduced from, the identity of

the host target genes which VGAM831 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11599] Nucleotide sequences of the VGAM831 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM831 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM831 are further described hereinbelow with reference to Table 1.

[11600] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM831 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11601] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 832 (VGAM832) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11602] VGAM832 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM832 was detected is described hereinabove with reference to Figs. 2–8.

[11603] VGAM832 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11604] VGAM832 gene, herein designated VGAM GENE, encodes a VGAM832 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM832 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM832 precursor RNA is designated SEQ ID:818, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:818 is located at position 52788 relative to the genome of Human herpesvirus 6B.

[11605] VGAM832 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM832 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11606] An enzyme complex designated DICER COMPLEX, dices the VGAM832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM832 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM832 RNA is designated SEQ ID:3543, and is provided hereinbelow with reference to the sequence listing part.

[11607] VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM832 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11608] VGAM832 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM832 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM832 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11609] The complementary binding of VGAM832 RNA, herein designated VGAM RNA, to host target binding sites on VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM832 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM832 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11610] It is appreciated that VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM832 host target genes. The mRNA of each one of this plurality of VGAM832 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM832 RNA, herein designated VGAM RNA, and which when bound by VGAM832 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM832 host target proteins.

[11611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM832 gene, herein designated VGAM GENE, on one or more VGAM832 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11612] It is yet further appreciated that a function of VGAM832 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM832 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM832

correlate with, and may be deduced from, the identity of the host target genes which VGAM832 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11613] Nucleotide sequences of the VGAM832 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM832 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM832 are further described hereinbelow with reference to Table 1.

[11614] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM832 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11615] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 833 (VGAM833) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[11616] VGAM833 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM833 was detected is described hereinabove with reference to Figs. 2–8.

[11617] VGAM833 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11618] VGAM833 gene, herein designated VGAM GENE, encodes a VGAM833 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM833 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM833 precursor RNA is designated SEQ ID:819, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:819 is located at position 185114 relative to the genome of Monkeypox virus.

[11619] VGAM833 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM833 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11620] An enzyme complex designated DICER COMPLEX, dices the VGAM833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM833 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM833 RNA is designated SEQ ID:3544, and is provided hereinbelow with reference to the sequence listing part.

[11621] VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM833 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11622] VGAM833 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM833 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM833 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11623] The complementary binding of VGAM833 RNA, herein designated VGAM RNA, to host target binding sites on VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM833 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM833 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11624] It is appreciated that VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM833 host target genes. The mRNA of each one of this plurality of VGAM833 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM833 RNA, herein designated VGAM RNA, and which when bound by VGAM833 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM833 host target proteins.

[11625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM833 gene, herein designated VGAM GENE, on one or more VGAM833 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11626] It is yet further appreciated that a function of VGAM833 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM833 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific

functions, and accordingly utilities, of VGAM833 correlate with, and may be deduced from, the identity of the host target genes which VGAM833 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11627] Nucleotide sequences of the VGAM833 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM833 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM833 are further described hereinbelow with reference to Table 1.

[11628] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM833 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11629] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 834 (VGAM834) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[11630] VGAM834 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM834 was detected is described hereinabove with reference to Figs. 2–8.

[11631] VGAM834 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11632] VGAM834 gene, herein designated VGAM GENE, encodes a VGAM834 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM834 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM834 precursor RNA is designated SEQ ID:820, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:820 is located at position 183909 relative to the genome of Monkeypox virus.

[11633] VGAM834 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11634] An enzyme complex designated DICER COMPLEX, dices the VGAM834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM834 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM834 RNA is designated SEQ ID:3545, and is provided hereinbelow with reference to the sequence listing part.

[11635] VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11636] VGAM834 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM834 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM834 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM834 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11637] The complementary binding of VGAM834 RNA, herein designated VGAM RNA, to host target binding sites on VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM834 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM834 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11638] It is appreciated that VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM834 host target genes. The mRNA of each one of this plurality of VGAM834 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM834 RNA, herein designated VGAM RNA, and which when bound by VGAM834 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM834 host target proteins.

[11639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM834 gene, herein designated VGAM GENE, on one or more VGAM834 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11640] It is yet further appreciated that a function of VGAM834 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM834 include diagnosis, prevention and

treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM834 correlate with, and may be deduced from, the identity of the host target genes which VGAM834 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11641] Nucleotide sequences of the VGAM834 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM834 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM834 are further described hereinbelow with reference to Table 1.

[11642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM834 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11643] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 835 (VGAM835) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11644] VGAM835 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM835 was detected is described hereinabove with reference to Figs. 2–8.

[11645] VGAM835 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM835 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11646] VGAM835 gene, herein designated VGAM GENE, encodes a VGAM835 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM835 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM835 precursor RNA is designated SEQ ID:821, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:821 is located at position 184176 relative to the genome of Monkeypox virus.

[11647] VGAM835 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11648] An enzyme complex designated DICER COMPLEX, dices the VGAM835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM835 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM835 RNA is designated SEQ ID:3546, and is provided hereinbelow with reference to the sequence listing part.

[11649] VGAM835 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11650] VGAM835 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM835 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM835 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11651] The complementary binding of VGAM835 RNA, herein designated VGAM RNA, to host target binding sites on VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM835 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM835 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11652] It is appreciated that VGAM835 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM835 host target genes. The mRNA of each one of this plurality of VGAM835 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM835 RNA, herein designated VGAM

RNA, and which when bound by VGAM835 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM835 host target proteins.

[11653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM835 gene, herein designated VGAM GENE, on one or more VGAM835 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11654] It is yet further appreciated that a function of VGAM835 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM835 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM835 correlate with, and may be deduced from, the identity of the host target genes which VGAM835 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11655] Nucleotide sequences of the VGAM835 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM835 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM835 are further described hereinbelow with reference to Table 1.

[11656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM835 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11657] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 836 (VGAM836) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11658] VGAM836 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM836 was detected is described hereinabove with reference to Figs. 2–8.

[11659] VGAM836 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11660] VGAM836 gene, herein designated VGAM GENE, encodes a VGAM836 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM836 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM836 precursor RNA is designated SEQ ID:822, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:822 is located at position 185395 relative

to the genome of Monkeypox virus.

[11661] VGAM836 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11662] An enzyme complex designated DICER COMPLEX, dices the VGAM836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM836 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM836 RNA is designated SEQ ID:3547, and is provided hereinbelow with reference to the sequence listing part.

[11663] VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[11664] VGAM836 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM836 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM836 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11665] The complementary binding of VGAM836 RNA, herein designated VGAM RNA, to host target binding sites on VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM836 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM836 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11666] It is appreciated that VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM836 host target genes. The mRNA of each one of this plurality of VGAM836 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM836 RNA, herein designated VGAM RNA, and which when bound by VGAM836 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM836 host target proteins.

[11667] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM836 gene, herein designated VGAM GENE, on one or more VGAM836 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11668] It is yet further appreciated that a function of VGAM836 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM836 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM836 correlate with, and may be deduced from, the identity of the host target genes which VGAM836 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11669] Nucleotide sequences of the VGAM836 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM836 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM836 are further described hereinbelow with reference to Table 1.

[11670] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM836 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11671] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 837 (VGAM837) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11672] VGAM837 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM837 was detected is described hereinabove with reference to Figs. 2–8.

[11673] VGAM837 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11674] VGAM837 gene, herein designated VGAM GENE, encodes a VGAM837 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM837 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM837 precursor RNA is designated SEQ ID:823, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:823 is located at position 183768 relative to the genome of Monkeypox virus.

[11675] VGAM837 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11676] An enzyme complex designated DICER COMPLEX, dices the VGAM837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM837 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM837 RNA is designated SEQ ID:3548, and is provided hereinbelow with reference to the sequence

listing part.

[11677] VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11678] VGAM837 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM837 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM837 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11679] The complementary binding of VGAM837 RNA, herein designated VGAM RNA, to host target binding sites on VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM837 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM837 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11680] It is appreciated that VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM837 host target genes. The mRNA of each one of this plurality of VGAM837 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM837 RNA, herein designated VGAM RNA, and which when bound by VGAM837 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM837 host target proteins.

[11681] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM837 gene, herein designated VGAM GENE, on one or more VGAM837 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11682] It is yet further appreciated that a function of VGAM837 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM837 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM837 correlate with, and may be deduced from, the identity of the host target genes which VGAM837 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[11683] Nucleotide sequences of the VGAM837 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM837 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM837 are further described hereinbelow with reference to Table 1.

[11684] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM837 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11685] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 838 (VGAM838) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11686] VGAM838 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM838 was detected is described hereinabove with reference to Figs. 2–8.

[11687] VGAM838 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11688] VGAM838 gene, herein designated VGAM GENE, encodes a VGAM838 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM838 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM838 precursor RNA is designated SEQ ID:824, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:824 is located at position 183284 relative to the genome of Monkeypox virus.

[11689] VGAM838 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11690] An enzyme complex designated DICER COMPLEX, dices the VGAM838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM838 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM838 RNA is designated SEQ ID:3549, and

is provided hereinbelow with reference to the sequence listing part.

[11691] VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11692] VGAM838 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM838 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM838 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11693] The complementary binding of VGAM838 RNA, herein designated VGAM RNA, to host target binding sites on VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM838 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM838 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11694] It is appreciated that VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM838 host target genes. The mRNA of each one of this plurality of VGAM838 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM838 RNA, herein designated VGAM RNA, and which when bound by VGAM838 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM838 host target proteins.

[11695] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM838 gene, herein designated VGAM GENE, on one or more VGAM838 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11696] It is yet further appreciated that a function of VGAM838 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM838 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM838 correlate with, and may be deduced from, the identity of the host target genes which VGAM838 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11697] Nucleotide sequences of the VGAM838 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM838 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM838 are further described hereinbelow with reference to Table 1.

[11698] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM838 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11699] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 839 (VGAM839) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11700] VGAM839 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM839 was detected is described hereinabove with reference to Figs. 2–8.

[11701] VGAM839 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11702] VGAM839 gene, herein designated VGAM GENE, encodes a VGAM839 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM839 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM839 precursor RNA is

designated SEQ ID:825, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:825 is located at position 208402 relative to the genome of Fowlpox virus.

[11703] VGAM839 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11704] An enzyme complex designated DICER COMPLEX, dices the VGAM839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM839 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM839 RNA is designated SEQ ID:3550, and is provided hereinbelow with reference to the sequence listing part.

[11705] VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11706] VGAM839 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM839 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM839 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11707] The complementary binding of VGAM839 RNA, herein designated VGAM RNA, to host target binding sites on VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM839 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM839 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11708] It is appreciated that VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM839 host target genes. The mRNA of

each one of this plurality of VGAM839 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM839 RNA, herein designated VGAM RNA, and which when bound by VGAM839 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM839 host target proteins.

[11709] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM839 gene, herein designated VGAM GENE, on one or more VGAM839 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[11710] It is yet further appreciated that a function of VGAM839 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM839 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM839 correlate with, and may be deduced from, the identity of the host target genes which VGAM839 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11711] Nucleotide sequences of the VGAM839 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM839 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM839 are further described hereinbelow with reference to Table 1.

[11712] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM839 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[11713] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 840 (VGAM840) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11714] VGAM840 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM840 was detected is described hereinabove with reference to Figs. 2–8.

[11715] VGAM840 gene, herein designated VGAM GENE, is a viral gene contained in the genome of ictalurid herpesvirus 1. VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11716] VGAM840 gene, herein designated VGAM GENE, encodes a VGAM840 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM840 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM840 precursor RNA is designated SEQ ID:826, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:826 is located at position 53374 relative to the genome of ictalurid herpesvirus 1.

[11717] VGAM840 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11718] An enzyme complex designated DICER COMPLEX, dices the VGAM840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM840 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM840 RNA is designated SEQ ID:3551, and is provided hereinbelow with reference to the sequence listing part.

[11719] VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11720] VGAM840 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM840 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM840 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11721] The complementary binding of VGAM840 RNA, herein designated VGAM RNA, to host target binding sites on VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM840 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM840 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11722] It is appreciated that VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM840 host target genes. The mRNA of each one of this plurality of VGAM840 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM840 RNA, herein designated VGAM RNA, and which when bound by VGAM840 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM840 host target proteins.

[11723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM840 gene, herein designated VGAM GENE, on one or more VGAM840 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [11724] It is yet further appreciated that a function of VGAM840 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM840 include diagnosis, prevention and treatment of viral infection by ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM840 correlate with, and may be deduced from, the identity of the host target genes which VGAM840 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [11725] Nucleotide sequences of the VGAM840 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM840 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM840 are further described hereinbelow with reference to Table 1.
- [11726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM840 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11727] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 841 (VGAM841) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11728] VGAM841 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM841 was detected is described hereinabove with reference to Figs. 2–8.

[11729] VGAM841 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM841 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11730] VGAM841 gene, herein designated VGAM GENE, encodes a VGAM841 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM841 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM841 precursor RNA is designated SEQ ID:827, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:827 is located at position 161925 relative to the genome of Equine herpesvirus 2.

[11731] VGAM841 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11732] An enzyme complex designated DICER COMPLEX, dices the VGAM841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM841 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM841 RNA is designated SEQ ID:3552, and is provided hereinbelow with reference to the sequence listing part.

[11733] VGAM841 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11734] VGAM841 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM841 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM841 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11735] The complementary binding of VGAM841 RNA, herein designated VGAM RNA, to host target binding sites on VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM841 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM841 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11736] It is appreciated that VGAM841 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM841 host target genes. The mRNA of each one of this plurality of VGAM841 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM841 RNA, herein designated VGAM RNA, and which when bound by VGAM841 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM841 host target proteins.

[11737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM841 gene, herein designated VGAM GENE, on one or more VGAM841 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11738] It is yet further appreciated that a function of VGAM841 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM841 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM841 correlate with, and may be deduced from, the identity of the host target genes which VGAM841 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11739] Nucleotide sequences of the VGAM841 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM841 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM841 are further described hereinbelow with reference to Table 1.

[11740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM841 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11741] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 842 (VGAM842) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11742] VGAM842 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM842 was detected is described hereinabove with reference to Figs. 2–8.

[11743] VGAM842 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11744] VGAM842 gene, herein designated VGAM GENE, encodes a VGAM842 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM842 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM842 precursor RNA is designated SEQ ID:828, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:828 is located at position 161225 relative to the genome of Equine herpesvirus 2.

[11745] VGAM842 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11746] An enzyme complex designated DICER COMPLEX, dices the VGAM842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM842 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM842 RNA is designated SEQ ID:3553, and is provided hereinbelow with reference to the sequence listing part.

[11747] VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11748] VGAM842 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM842 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM842 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11749] The complementary binding of VGAM842 RNA, herein designated VGAM RNA, to host target binding sites on VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM842 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM842 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11750] It is appreciated that VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM842 host target genes. The mRNA of each one of this plurality of VGAM842 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM842 RNA, herein designated VGAM RNA, and which when bound by VGAM842 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM842 host target proteins.

[11751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM842 gene, herein designated VGAM GENE, on one or more VGAM842 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11752] It is yet further appreciated that a function of VGAM842 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM842 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM842 correlate with, and may be deduced from, the identity of the host target genes which VGAM842 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11753] Nucleotide sequences of the VGAM842 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM842 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM842 are further described hereinbelow with reference to Table 1.

[11754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM842 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11755] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 843 (VGAM843) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11756] VGAM843 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM843 was detected is described hereinabove with reference to Figs. 2–8.

[11757] VGAM843 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM843 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11758] VGAM843 gene, herein designated VGAM GENE, encodes a VGAM843 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM843 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM843 precursor RNA is designated SEQ ID:829, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:829 is located at position 120975 relative to the genome of Monkeypox virus.

[11759] VGAM843 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11760] An enzyme complex designated DICER COMPLEX, dices the VGAM843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM843 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM843 RNA is designated SEQ ID:3554, and is provided hereinbelow with reference to the sequence listing part.

[11761] VGAM843 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11762] VGAM843 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM843 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM843 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11763] The complementary binding of VGAM843 RNA, herein designated VGAM RNA, to host target binding sites on VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM843 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM843 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[11764] It is appreciated that VGAM843 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM843 host target genes. The mRNA of each one of this plurality of VGAM843 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM843 RNA, herein designated VGAM RNA, and which when bound by VGAM843 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM843 host target proteins.

[11765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM843 gene, herein designated VGAM GENE, on one or more VGAM843 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11766] It is yet further appreciated that a function of VGAM843 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM843 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM843 correlate with, and may be deduced from, the identity of the host target genes which VGAM843 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11767] Nucleotide sequences of the VGAM843 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM843 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM843 are further described hereinbelow with reference to Table 1.

[11768] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM843 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11769] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 844 (VGAM844) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11770] VGAM844 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM844 was detected is described hereinabove with reference to Figs. 2-8.

[11771] VGAM844 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11772] VGAM844 gene, herein designated VGAM GENE, encodes a VGAM844 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM844 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM844 precursor RNA is designated SEQ ID:830, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:830 is located at position 121671 relative to the genome of Monkeypox virus.

[11773] VGAM844 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11774] An enzyme complex designated DICER COMPLEX, dices the VGAM844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM844 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM844 RNA is designated SEQ ID:3555, and is provided hereinbelow with reference to the sequence listing part.

[11775] VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11776] VGAM844 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM844 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM844 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11777] The complementary binding of VGAM844 RNA, herein designated VGAM RNA, to host target binding sites on VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM844 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM844 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11778] It is appreciated that VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM844 host target genes. The mRNA of each one of this plurality of VGAM844 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM844 RNA, herein designated VGAM RNA, and which when bound by VGAM844 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM844 host target proteins.

[11779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM844 gene, herein designated VGAM GENE, on one or more VGAM844 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11780] It is yet further appreciated that a function of VGAM844 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM844 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM844 correlate with, and may be deduced from, the identity of the host target genes which VGAM844 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11781] Nucleotide sequences of the VGAM844 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM844 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM844 are further described hereinbelow with reference to Table 1.

[11782] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM844 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11783] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 845 (VGAM845) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11784] VGAM845 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM845 was detected is described hereinabove with reference to Figs. 2-8.

[11785] VGAM845 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM845 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11786] VGAM845 gene, herein designated VGAM GENE, encodes a

VGAM845 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM845 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM845 precursor RNA is designated SEQ ID:831, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:831 is located at position 132405 relative to the genome of Gallid herpesvirus 2.

[11787] VGAM845 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11788] An enzyme complex designated DICER COMPLEX, dices the VGAM845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM845 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM845 RNA is designated SEQ ID:3556, and is provided hereinbelow with reference to the sequence listing part.

[11789] VGAM845 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM845 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM845 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11790] VGAM845 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM845 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM845 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM845 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM845 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11791] The complementary binding of VGAM845 RNA, herein designated VGAM RNA, to host target binding sites on VGAM845 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM845 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM845 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11792] It is appreciated that VGAM845 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM845 host target genes. The mRNA of each one of this plurality of VGAM845 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM845 RNA, herein designated VGAM RNA, and which when bound by VGAM845 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM845 host target proteins.

[11793] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM845 gene, herein designated VGAM GENE, on one or more VGAM845 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11794] It is yet further appreciated that a function of VGAM845 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM845 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM845 correlate with, and may be deduced from, the identity of the host target genes which VGAM845 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11795] Nucleotide sequences of the VGAM845 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM845 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM845 are further de-

scribed hereinbelow with reference to Table 1.

[11796] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM845 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11797] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 846 (VGAM846) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11798] VGAM846 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM846 was detected is described hereinabove with reference to Figs. 2-8.

[11799] VGAM846 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11800] VGAM846 gene, herein designated VGAM GENE, encodes a VGAM846 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM846 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM846 precursor RNA is designated SEQ ID:832, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:832 is located at position 132582 relative to the genome of Gallid herpesvirus 2.

[11801] VGAM846 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11802] An enzyme complex designated DICER COMPLEX, dices the VGAM846 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM846 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM846 RNA is designated SEQ ID:3557, and is provided hereinbelow with reference to the sequence listing part.

[11803] VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11804] VGAM846 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM846 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM846 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11805] The complementary binding of VGAM846 RNA, herein designated VGAM RNA, to host target binding sites on VGAM846 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM846 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM846 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11806] It is appreciated that VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM846 host target genes. The mRNA of each one of this plurality of VGAM846 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM846 RNA, herein designated VGAM RNA, and which when bound by VGAM846 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM846 host target proteins.

[11807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM846 gene, herein designated VGAM GENE, on one or more VGAM846 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11808] It is yet further appreciated that a function of VGAM846 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM846 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM846 correlate with, and may be deduced from, the identity of the host target genes which VGAM846 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11809] Nucleotide sequences of the VGAM846 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM846 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM846 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM846 are further described hereinbelow with reference to Table 1.

[11810] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM846 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11811] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 847 (VGAM847) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11812] VGAM847 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM847 was detected is described hereinabove with reference to Figs. 2-8.

[11813] VGAM847 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM847 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[11814] VGAM847 gene, herein designated VGAM GENE, encodes a VGAM847 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM847 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM847 precursor RNA is designated SEQ ID:833, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:833 is located at position 132873 relative to the genome of Gallid herpesvirus 2.

[11815] VGAM847 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11816] An enzyme complex designated DICER COMPLEX, dices

the VGAM847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM847 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM847 RNA is designated SEQ ID:3558, and is provided hereinbelow with reference to the sequence listing part.

[11817] VGAM847 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11818] VGAM847 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM847 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM847 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM847 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11819] The complementary binding of VGAM847 RNA, herein designated VGAM RNA, to host target binding sites on VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM847 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM847 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11820] It is appreciated that VGAM847 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM847 host target genes. The mRNA of each one of this plurality of VGAM847 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM847 RNA, herein designated VGAM RNA, and which when bound by VGAM847 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM847 host target proteins.

[11821] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM847 gene, herein designated VGAM GENE, on one or more VGAM847 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11822] It is yet further appreciated that a function of VGAM847 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM847 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM847 correlate with, and may be deduced from, the identity of the host target genes which VGAM847 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11823] Nucleotide sequences of the VGAM847 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM847 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM847 are further described hereinbelow with reference to Table 1.

[11824] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM847 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11825] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 848 (VGAM848) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11826] VGAM848 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM848 was detected is described hereinabove with reference to Figs. 2-8.

[11827] VGAM848 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM848 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[11828] VGAM848 gene, herein designated VGAM GENE, encodes a VGAM848 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM848 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM848 precursor RNA is designated SEQ ID:834, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:834 is located at position 132736 relative to the genome of Gallid herpesvirus 2.

[11829] VGAM848 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11830] An enzyme complex designated DICER COMPLEX, dices the VGAM848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM848 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM848 RNA is designated SEQ ID:3559, and is provided hereinbelow with reference to the sequence listing part.

[11831] VGAM848 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11832] VGAM848 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM848 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM848 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11833] The complementary binding of VGAM848 RNA, herein designated VGAM RNA, to host target binding sites on VGAM848 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM848 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM848 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11834] It is appreciated that VGAM848 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM848 host target genes. The mRNA of each one of this plurality of VGAM848 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM848 RNA, herein designated VGAM RNA, and which when bound by VGAM848 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM848 host target proteins.

[11835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM848 gene, herein designated VGAM GENE, on one or more VGAM848 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11836] It is yet further appreciated that a function of VGAM848 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM848 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM848 correlate with, and may be deduced from, the identity of the host target genes which VGAM848 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11837] Nucleotide sequences of the VGAM848 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM848 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM848 are further described hereinbelow with reference to Table 1.

[11838] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM848 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11839] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 849 (VGAM849) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11840] VGAM849 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM849 was detected is described hereinabove with reference to Figs. 2-8.

[11841] VGAM849 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease

virus 1. VGAM849 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11842] VGAM849 gene, herein designated VGAM GENE, encodes a VGAM849 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM849 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM849 precursor RNA is designated SEQ ID:835, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:835 is located at position 12797 relative to the genome of Lymphocystis disease virus 1.

[11843] VGAM849 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[11844] An enzyme complex designated DICER COMPLEX, dices the VGAM849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM849 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM849 RNA is designated SEQ ID:3560, and is provided hereinbelow with reference to the sequence listing part.

[11845] VGAM849 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11846] VGAM849 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM849 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM849 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11847] The complementary binding of VGAM849 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM849 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM849 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11848] It is appreciated that VGAM849 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM849 host target genes. The mRNA of each one of this plurality of VGAM849 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM849 RNA, herein designated VGAM RNA, and which when bound by VGAM849 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM849 host target proteins.

[11849] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM849 gene, herein designated VGAM GENE, on one or more VGAM849 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11850] It is yet further appreciated that a function of VGAM849 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM849 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM849 correlate with, and may be deduced from, the identity of the host target genes which VGAM849 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11851] Nucleotide sequences of the VGAM849 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM849 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM849 are further described hereinbelow with reference to Table 1.

[11852] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM849 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11853] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 850 (VGAM850) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11854] VGAM850 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM850 was detected is described hereinabove with reference to Figs. 2-8.

[11855] VGAM850 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Lymphocystis disease virus 1. VGAM850 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11856] VGAM850 gene, herein designated VGAM GENE, encodes a VGAM850 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM850 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM850 precursor RNA is designated SEQ ID:836, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:836 is located at position 13536 relative to the genome of Lymphocystis disease virus 1.

[11857] VGAM850 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11858] An enzyme complex designated DICER COMPLEX, dices the VGAM850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM850 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM850 RNA is designated SEQ ID:3561, and is provided hereinbelow with reference to the sequence listing part.

[11859] VGAM850 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11860] VGAM850 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM850 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM850 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11861] The complementary binding of VGAM850 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM850 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM850 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11862] It is appreciated that VGAM850 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM850 host target genes. The mRNA of each one of this plurality of VGAM850 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM850 RNA, herein designated VGAM RNA, and which when bound by VGAM850 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM850 host target proteins.

[11863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM850 gene, herein designated VGAM GENE, on one or more VGAM850 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11864] It is yet further appreciated that a function of VGAM850 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM850 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM850 correlate with, and may be deduced from, the identity of the host target genes which VGAM850 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11865] Nucleotide sequences of the VGAM850 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM850 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM850 are further described hereinbelow with reference to Table 1.

[11866] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM850 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11867] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 851 (VGAM851) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11868] VGAM851 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM851 was detected is described hereinabove with reference to Figs. 2-8.

[11869] VGAM851 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM851 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11870] VGAM851 gene, herein designated VGAM GENE, encodes a VGAM851 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM851 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM851 precursor RNA is designated SEQ ID:837, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:837 is located at position 13906 relative to the genome of Lymphocystis disease virus 1.

[11871] VGAM851 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11872] An enzyme complex designated DICER COMPLEX, dices the VGAM851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM851 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM851 RNA is designated SEQ ID:3562, and is provided hereinbelow with reference to the sequence listing part.

[11873] VGAM851 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[11874] VGAM851 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM851 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM851 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11875] The complementary binding of VGAM851 RNA, herein designated VGAM RNA, to host target binding sites on VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM851 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM851 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11876] It is appreciated that VGAM851 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM851 host target genes. The mRNA of each one of this plurality of VGAM851 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM851 RNA, herein designated VGAM RNA, and which when bound by VGAM851 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM851 host target proteins.

[11877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM851 gene, herein designated VGAM GENE, on one or

more VGAM851 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11878] It is yet further appreciated that a function of VGAM851 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM851 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM851 correlate with, and may be deduced from, the identity of the host target genes which VGAM851 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11879] Nucleotide sequences of the VGAM851 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM851 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM851 are further described hereinbelow with reference to Table 1.

[11880] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM851 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11881] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 852 (VGAM852) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11882] VGAM852 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM852 was detected is described

hereinabove with reference to Figs. 2–8.

[11883] VGAM852 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11884] VGAM852 gene, herein designated VGAM GENE, encodes a VGAM852 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM852 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM852 precursor RNA is designated SEQ ID:838, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:838 is located at position 135041 relative to the genome of Molluscum contagiosum virus.

[11885] VGAM852 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11886] An enzyme complex designated DICER COMPLEX, dices the VGAM852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM852 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM852 RNA is designated SEQ ID:3563, and is provided hereinbelow with reference to the sequence listing part.

[11887] VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11888] VGAM852 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM852 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM852 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3'UTR and 5'UTR regions.

[11889] The complementary binding of VGAM852 RNA, herein designated VGAM RNA, to host target binding sites on VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM852 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM852 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11890] It is appreciated that VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM852 host target genes. The mRNA of each one of this plurality of VGAM852 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM852 RNA, herein designated VGAM RNA, and which when bound by VGAM852 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM852 host target proteins.

[11891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM852 gene, herein designated VGAM GENE, on one or more VGAM852 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11892] It is yet further appreciated that a function of VGAM852 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM852 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM852 correlate with, and may be deduced from, the identity of the host target genes which VGAM852 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[11893] Nucleotide sequences of the VGAM852 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM852 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM852 are further described hereinbelow with reference to Table 1.

[11894] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM852 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11895] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 853 (VGAM853) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11896] VGAM853 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM853 was detected is described hereinabove with reference to Figs. 2–8.

[11897] VGAM853 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM853 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11898] VGAM853 gene, herein designated VGAM GENE, encodes a VGAM853 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM853 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM853 precursor RNA is designated SEQ ID:839, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:839 is located at position 202536 relative to the genome of Ectromelia virus.

[11899] VGAM853 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11900] An enzyme complex designated DICER COMPLEX, dices the VGAM853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM853 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM853 RNA is designated SEQ ID:3564, and is provided hereinbelow with reference to the sequence listing part.

[11901] VGAM853 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11902] VGAM853 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM853 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM853 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11903] The complementary binding of VGAM853 RNA, herein designated VGAM RNA, to host target binding sites on VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM853 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM853 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11904] It is appreciated that VGAM853 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM853 host target genes. The mRNA of each one of this plurality of VGAM853 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM853 RNA, herein designated VGAM RNA, and which when bound by VGAM853 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM853 host target proteins.

[11905] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM853 gene, herein designated VGAM GENE, on one or more VGAM853 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11906] It is yet further appreciated that a function of VGAM853 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM853 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM853 correlate with, and may be deduced from, the identity of the host target genes which VGAM853 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[11907] Nucleotide sequences of the VGAM853 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM853 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM853 are further described hereinbelow with reference to Table 1.

[11908] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM853 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11909] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 854 (VGAM854) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11910] VGAM854 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM854 was detected is described hereinabove with reference to Figs. 2–8.

[11911] VGAM854 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM854 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11912] VGAM854 gene, herein designated VGAM GENE, encodes a VGAM854 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM854 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM854 precursor RNA is designated SEQ ID:840, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:840 is located at position 79626 relative to the genome of Amsacta moorei entomopoxvirus.

[11913] VGAM854 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11914] An enzyme complex designated DICER COMPLEX, dices the VGAM854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM854 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM854 RNA is designated SEQ ID:3565, and is provided hereinbelow with reference to the sequence listing part.

[11915] VGAM854 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11916] VGAM854 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM854 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM854 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11917] The complementary binding of VGAM854 RNA, herein designated VGAM RNA, to host target binding sites on VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM854 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM854 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11918] It is appreciated that VGAM854 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM854 host target genes. The mRNA of each one of this plurality of VGAM854 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM854 RNA, herein designated VGAM RNA, and which when bound by VGAM854 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM854 host target proteins.

[11919] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM854 gene, herein designated VGAM GENE, on one or more VGAM854 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11920] It is yet further appreciated that a function of VGAM854 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM854 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM854 correlate with, and may be deduced from,

the identity of the host target genes which VGAM854 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11921] Nucleotide sequences of the VGAM854 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM854 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM854 are further described hereinbelow with reference to Table 1.

[11922] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM854 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11923] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 855 (VGAM855) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11924] VGAM855 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM855 was detected is described hereinabove with reference to Figs. 2–8.

[11925] VGAM855 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11926] VGAM855 gene, herein designated VGAM GENE, encodes a VGAM855 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM855 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM855 precursor RNA is designated SEQ ID:841, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:841 is located at position 45064 relative to the genome of African swine fever virus.

[11927] VGAM855 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM855 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11928] An enzyme complex designated DICER COMPLEX, dices the VGAM855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM855 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM855 RNA is designated SEQ ID:3566, and is provided hereinbelow with reference to the sequence listing part.

[11929] VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM855 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11930] VGAM855 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM855 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM855 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11931] The complementary binding of VGAM855 RNA, herein designated VGAM RNA, to host target binding sites on VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM855 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM855 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11932] It is appreciated that VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM855 host target genes. The mRNA of each one of this plurality of VGAM855 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM855 RNA, herein designated VGAM RNA, and which when bound by VGAM855 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM855 host target proteins.

[11933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM855 gene, herein designated VGAM GENE, on one or more VGAM855 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11934] It is yet further appreciated that a function of VGAM855 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM855 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM855

correlate with, and may be deduced from, the identity of the host target genes which VGAM855 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11935] Nucleotide sequences of the VGAM855 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM855 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM855 are further described hereinbelow with reference to Table 1.

[11936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM855 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11937] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 856 (VGAM856) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[11938] VGAM856 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM856 was detected is described hereinabove with reference to Figs. 2–8.

[11939] VGAM856 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11940] VGAM856 gene, herein designated VGAM GENE, encodes a VGAM856 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM856 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM856 precursor RNA is designated SEQ ID:842, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:842 is located at position 43493 relative to the genome of African swine fever virus.

[11941] VGAM856 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM856 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11942] An enzyme complex designated DICER COMPLEX, dices the VGAM856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM856 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM856 RNA is designated SEQ ID:3567, and is provided hereinbelow with reference to the sequence listing part.

[11943] VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM856 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11944] VGAM856 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM856 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM856 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11945] The complementary binding of VGAM856 RNA, herein designated VGAM RNA, to host target binding sites on VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM856 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM856 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11946] It is appreciated that VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM856 host target genes. The mRNA of each one of this plurality of VGAM856 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM856 RNA, herein designated VGAM RNA, and which when bound by VGAM856 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM856 host target proteins.

[11947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM856 gene, herein designated VGAM GENE, on one or more VGAM856 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11948] It is yet further appreciated that a function of VGAM856 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM856 include diagnosis, prevention and treatment of viral infection by African swine fever virus.

Specific functions, and accordingly utilities, of VGAM856 correlate with, and may be deduced from, the identity of the host target genes which VGAM856 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11949] Nucleotide sequences of the VGAM856 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM856 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM856 are further described hereinbelow with reference to Table 1.

[11950] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM856 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11951] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 857 (VGAM857) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[11952] VGAM857 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM857 was detected is described hereinabove with reference to Figs. 2–8.

[11953] VGAM857 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11954] VGAM857 gene, herein designated VGAM GENE, encodes a VGAM857 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM857 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM857 precursor RNA is designated SEQ ID:843, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:843 is located at position 134388 relative to the genome of Ectromelia virus.

[11955] VGAM857 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11956] An enzyme complex designated DICER COMPLEX, dices the VGAM857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM857 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM857 RNA is designated SEQ ID:3568, and is provided hereinbelow with reference to the sequence listing part.

[11957] VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11958] VGAM857 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM857 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM857 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM857 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11959] The complementary binding of VGAM857 RNA, herein designated VGAM RNA, to host target binding sites on VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM857 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM857 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11960] It is appreciated that VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM857 host target genes. The mRNA of each one of this plurality of VGAM857 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM857 RNA, herein designated VGAM RNA, and which when bound by VGAM857 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM857 host target proteins.

[11961] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM857 gene, herein designated VGAM GENE, on one or more VGAM857 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11962] It is yet further appreciated that a function of VGAM857 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM857 include diagnosis, prevention and

treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM857 correlate with, and may be deduced from, the identity of the host target genes which VGAM857 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11963] Nucleotide sequences of the VGAM857 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM857 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM857 are further described hereinbelow with reference to Table 1.

[11964] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM857 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11965] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 858 (VGAM858) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11966] VGAM858 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM858 was detected is described hereinabove with reference to Figs. 2–8.

[11967] VGAM858 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM858 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11968] VGAM858 gene, herein designated VGAM GENE, encodes a VGAM858 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM858 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM858 precursor RNA is designated SEQ ID:844, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:844 is located at position 132888 relative to the genome of Ectromelia virus.

[11969] VGAM858 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11970] An enzyme complex designated DICER COMPLEX, dices the VGAM858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM858 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM858 RNA is designated SEQ ID:3569, and is provided hereinbelow with reference to the sequence listing part.

[11971] VGAM858 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11972] VGAM858 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM858 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM858 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11973] The complementary binding of VGAM858 RNA, herein designated VGAM RNA, to host target binding sites on VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM858 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM858 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11974] It is appreciated that VGAM858 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM858 host target genes. The mRNA of each one of this plurality of VGAM858 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM858 RNA, herein designated VGAM

RNA, and which when bound by VGAM858 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM858 host target proteins.

[11975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM858 gene, herein designated VGAM GENE, on one or more VGAM858 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11976] It is yet further appreciated that a function of VGAM858 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM858 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM858 correlate with, and may be deduced from, the identity of the host target genes which VGAM858 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11977] Nucleotide sequences of the VGAM858 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM858 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM858 are further described hereinbelow with reference to Table 1.

[11978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM858 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11979] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 859 (VGAM859) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11980] VGAM859 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM859 was detected is described hereinabove with reference to Figs. 2–8.

[11981] VGAM859 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11982] VGAM859 gene, herein designated VGAM GENE, encodes a VGAM859 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM859 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM859 precursor RNA is designated SEQ ID:845, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:845 is located at position 126158 relative

to the genome of Camelpox virus.

[11983] VGAM859 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11984] An enzyme complex designated DICER COMPLEX, dices the VGAM859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM859 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM859 RNA is designated SEQ ID:3570, and is provided hereinbelow with reference to the sequence listing part.

[11985] VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11986] VGAM859 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM859 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM859 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11987] The complementary binding of VGAM859 RNA, herein designated VGAM RNA, to host target binding sites on VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM859 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM859 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11988] It is appreciated that VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM859 host target genes. The mRNA of each one of this plurality of VGAM859 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM859 RNA, herein designated VGAM RNA, and which when bound by VGAM859 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM859 host target proteins.

[11989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM859 gene, herein designated VGAM GENE, on one or more VGAM859 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11990] It is yet further appreciated that a function of VGAM859 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM859 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM859 correlate with, and may be deduced from, the identity of the host target genes which VGAM859 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11991] Nucleotide sequences of the VGAM859 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM859 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM859 are further described hereinbelow with reference to Table 1.

[11992] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM859 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11993] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 860 (VGAM860) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11994] VGAM860 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM860 was detected is described hereinabove with reference to Figs. 2–8.

[11995] VGAM860 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11996] VGAM860 gene, herein designated VGAM GENE, encodes a VGAM860 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM860 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM860 precursor RNA is designated SEQ ID:846, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:846 is located at position 127064 relative to the genome of Camelpox virus.

[11997] VGAM860 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11998] An enzyme complex designated DICER COMPLEX, dices the VGAM860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM860 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM860 RNA is designated SEQ ID:3571, and is provided hereinbelow with reference to the sequence

listing part.

[11999] VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12000] VGAM860 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM860 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM860 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12001] The complementary binding of VGAM860 RNA, herein designated VGAM RNA, to host target binding sites on VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM860 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM860 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12002] It is appreciated that VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM860 host target genes. The mRNA of each one of this plurality of VGAM860 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM860 RNA, herein designated VGAM RNA, and which when bound by VGAM860 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM860 host target proteins.

[12003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM860 gene, herein designated VGAM GENE, on one or more VGAM860 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12004] It is yet further appreciated that a function of VGAM860 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM860 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM860 correlate with, and may be deduced from, the identity of the host target genes which VGAM860 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[12005] Nucleotide sequences of the VGAM860 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM860 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM860 are further described hereinbelow with reference to Table 1.

[12006] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM860 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12007] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 861 (VGAM861) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12008] VGAM861 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM861 was detected is described hereinabove with reference to Figs. 2–8.

[12009] VGAM861 gene, herein designated VGAM GENE, is a viral gene contained in the genome of ictalurid herpesvirus 1. VGAM861 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12010] VGAM861 gene, herein designated VGAM GENE, encodes a VGAM861 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM861 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM861 precursor RNA is designated SEQ ID:847, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:847 is located at position 97141 relative to the genome of ictalurid herpesvirus 1.

[12011] VGAM861 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12012] An enzyme complex designated DICER COMPLEX, dices the VGAM861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM861 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM861 RNA is designated SEQ ID:3572, and

is provided hereinbelow with reference to the sequence listing part.

[12013] VGAM861 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12014] VGAM861 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM861 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM861 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12015] The complementary binding of VGAM861 RNA, herein designated VGAM RNA, to host target binding sites on VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM861 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM861 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12016] It is appreciated that VGAM861 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM861 host target genes. The mRNA of each one of this plurality of VGAM861 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM861 RNA, herein designated VGAM RNA, and which when bound by VGAM861 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM861 host target proteins.

[12017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM861 gene, herein designated VGAM GENE, on one or more VGAM861 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12018] It is yet further appreciated that a function of VGAM861 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM861 include diagnosis, prevention and treatment of viral infection by ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM861 correlate with, and may be deduced from, the identity of the host target genes which VGAM861 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12019] Nucleotide sequences of the VGAM861 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM861 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM861 are further described hereinbelow with reference to Table 1.

[12020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM861 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12021] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 862 (VGAM862) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12022] VGAM862 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM862 was detected is described hereinabove with reference to Figs. 2–8.

[12023] VGAM862 gene, herein designated VGAM GENE, is a viral gene contained in the genome of ictalurid herpesvirus 1. VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12024] VGAM862 gene, herein designated VGAM GENE, encodes a VGAM862 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM862 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM862 precursor RNA is

designated SEQ ID:848, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:848 is located at position 97256 relative to the genome of ictalurid herpesvirus 1.

[12025] VGAM862 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12026] An enzyme complex designated DICER COMPLEX, dices the VGAM862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM862 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide se-

quence of VGAM862 RNA is designated SEQ ID:3573, and is provided hereinbelow with reference to the sequence listing part.

[12027] VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12028] VGAM862 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM862 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM862 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12029] The complementary binding of VGAM862 RNA, herein designated VGAM RNA, to host target binding sites on VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM862 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM862 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12030] It is appreciated that VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM862 host target genes. The mRNA of

each one of this plurality of VGAM862 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM862 RNA, herein designated VGAM RNA, and which when bound by VGAM862 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM862 host target proteins.

[12031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM862 gene, herein designated VGAM GENE, on one or more VGAM862 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[12032] It is yet further appreciated that a function of VGAM862 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM862 include diagnosis, prevention and treatment of viral infection by ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM862 correlate with, and may be deduced from, the identity of the host target genes which VGAM862 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12033] Nucleotide sequences of the VGAM862 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM862 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM862 are further described hereinbelow with reference to Table 1.

[12034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM862 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[12035] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 863 (VGAM863) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12036] VGAM863 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM863 was detected is described hereinabove with reference to Figs. 2–8.

[12037] VGAM863 gene, herein designated VGAM GENE, is a viral gene contained in the genome of ictalurid herpesvirus 1. VGAM863 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12038] VGAM863 gene, herein designated VGAM GENE, encodes a VGAM863 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM863 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM863 precursor RNA is designated SEQ ID:849, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:849 is located at position 99448 relative to the genome of ictalurid herpesvirus 1.

[12039] VGAM863 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12040] An enzyme complex designated DICER COMPLEX, dices the VGAM863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM863 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM863 RNA is designated SEQ ID:3574, and is provided hereinbelow with reference to the sequence listing part.

[12041] VGAM863 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12042] VGAM863 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM863 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM863 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12043] The complementary binding of VGAM863 RNA, herein designated VGAM RNA, to host target binding sites on VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM863 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM863 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12044] It is appreciated that VGAM863 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM863 host target genes. The mRNA of each one of this plurality of VGAM863 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM863 RNA, herein designated VGAM RNA, and which when bound by VGAM863 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM863 host target proteins.

[12045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM863 gene, herein designated VGAM GENE, on one or more VGAM863 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[12046] It is yet further appreciated that a function of VGAM863 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM863 include diagnosis, prevention and treatment of viral infection by ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM863 correlate with, and may be deduced from, the identity of the host target genes which VGAM863 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12047] Nucleotide sequences of the VGAM863 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM863 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM863 are further described hereinbelow with reference to Table 1.

[12048] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM863 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12049] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 864 (VGAM864) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12050] VGAM864 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM864 was detected is described hereinabove with reference to Figs. 2–8.

[12051] VGAM864 gene, herein designated VGAM GENE, is a viral gene contained in the genome of ictalurid herpesvirus 1. VGAM864 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12052] VGAM864 gene, herein designated VGAM GENE, encodes a VGAM864 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM864 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM864 precursor RNA is designated SEQ ID:850, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:850 is located at position 96883 relative to the genome of ictalurid herpesvirus 1.

[12053] VGAM864 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12054] An enzyme complex designated DICER COMPLEX, dices the VGAM864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM864 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM864 RNA is designated SEQ ID:3575, and is provided hereinbelow with reference to the sequence listing part.

[12055] VGAM864 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12056] VGAM864 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM864 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM864 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12057] The complementary binding of VGAM864 RNA, herein designated VGAM RNA, to host target binding sites on VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM864 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM864 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12058] It is appreciated that VGAM864 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM864 host target genes. The mRNA of each one of this plurality of VGAM864 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM864 RNA, herein designated VGAM RNA, and which when bound by VGAM864 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM864 host target proteins.

[12059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM864 gene, herein designated VGAM GENE, on one or more VGAM864 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12060] It is yet further appreciated that a function of VGAM864 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM864 include diagnosis, prevention and treatment of viral infection by ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM864 correlate with, and may be deduced from, the identity of the host target genes which VGAM864 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12061] Nucleotide sequences of the VGAM864 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM864 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM864 are further described hereinbelow with reference to Table 1.

[12062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM864 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12063] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 865 (VGAM865) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12064] VGAM865 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM865 was detected is described hereinabove with reference to Figs. 2–8.

[12065] VGAM865 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12066] VGAM865 gene, herein designated VGAM GENE, encodes a VGAM865 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM865 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM865 precursor RNA is designated SEQ ID:851, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:851 is located at position 38140 relative to the genome of Swinepox virus.

[12067] VGAM865 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12068] An enzyme complex designated DICER COMPLEX, dices the VGAM865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM865 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM865 RNA is designated SEQ ID:3576, and is provided hereinbelow with reference to the sequence listing part.

[12069] VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12070] VGAM865 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM865 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM865 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12071] The complementary binding of VGAM865 RNA, herein designated VGAM RNA, to host target binding sites on VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM865 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM865 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12072] It is appreciated that VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM865 host target genes. The mRNA of each one of this plurality of VGAM865 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM865 RNA, herein designated VGAM RNA, and which when bound by VGAM865 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM865 host target proteins.

[12073] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM865 gene, herein designated VGAM GENE, on one or more VGAM865 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12074] It is yet further appreciated that a function of VGAM865 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM865 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM865 correlate with, and may be deduced from, the identity of the host target genes which VGAM865 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12075] Nucleotide sequences of the VGAM865 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM865 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM865 are further described hereinbelow with reference to Table 1.

[12076] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM865 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12077] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 866 (VGAM866) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12078] VGAM866 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM866 was detected is described hereinabove with reference to Figs. 2–8.

[12079] VGAM866 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM866 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12080] VGAM866 gene, herein designated VGAM GENE, encodes a VGAM866 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM866 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM866 precursor RNA is designated SEQ ID:852, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:852 is located at position 37456 relative to the genome of Swinepox virus.

[12081] VGAM866 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12082] An enzyme complex designated DICER COMPLEX, dices the VGAM866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM866 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM866 RNA is designated SEQ ID:3577, and is provided hereinbelow with reference to the sequence listing part.

[12083] VGAM866 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12084] VGAM866 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM866 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM866 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12085] The complementary binding of VGAM866 RNA, herein designated VGAM RNA, to host target binding sites on VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM866 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM866 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[12086] It is appreciated that VGAM866 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM866 host target genes. The mRNA of each one of this plurality of VGAM866 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM866 RNA, herein designated VGAM RNA, and which when bound by VGAM866 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM866 host target proteins.

[12087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM866 gene, herein designated VGAM GENE, on one or more VGAM866 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12088] It is yet further appreciated that a function of VGAM866 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM866 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM866 correlate with, and may be deduced from, the identity of the host target genes which VGAM866 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12089] Nucleotide sequences of the VGAM866 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM866 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM866 are further described hereinbelow with reference to Table 1.

[12090] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM866 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12091] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 867 (VGAM867) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12092] VGAM867 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM867 was detected is described hereinabove with reference to Figs. 2-8.

[12093] VGAM867 gene, herein designated VGAM GENE, is a viral gene contained in the genome of turkey adenovirus 3. VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12094] VGAM867 gene, herein designated VGAM GENE, encodes a VGAM867 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM867 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM867 precursor RNA is designated SEQ ID:853, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:853 is located at position 5962 relative to the genome of turkey adenovirus 3.

[12095] VGAM867 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12096] An enzyme complex designated DICER COMPLEX, dices the VGAM867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM867 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM867 RNA is designated SEQ ID:3578, and is provided hereinbelow with reference to the sequence listing part.

[12097] VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12098] VGAM867 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM867 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM867 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12099] The complementary binding of VGAM867 RNA, herein designated VGAM RNA, to host target binding sites on VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM867 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM867 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12100] It is appreciated that VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM867 host target genes. The mRNA of each one of this plurality of VGAM867 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM867 RNA, herein designated VGAM RNA, and which when bound by VGAM867 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM867 host target proteins.

[12101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM867 gene, herein designated VGAM GENE, on one or more VGAM867 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12102] It is yet further appreciated that a function of VGAM867 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM867 include diagnosis, prevention and treatment of viral infection by turkey adenovirus 3. Specific functions, and accordingly utilities, of VGAM867 correlate with, and may be deduced from, the identity of the host target genes which VGAM867 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12103] Nucleotide sequences of the VGAM867 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM867 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM867 are further described hereinbelow with reference to Table 1.

[12104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM867 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12105] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 868 (VGAM868) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12106] VGAM868 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM868 was detected is described hereinabove with reference to Figs. 2-8.

[12107] VGAM868 gene, herein designated VGAM GENE, is a viral gene contained in the genome of turkey adenovirus 3. VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12108] VGAM868 gene, herein designated VGAM GENE, encodes a

VGAM868 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM868 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM868 precursor RNA is designated SEQ ID:854, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:854 is located at position 5577 relative to the genome of turkey adenovirus 3.

[12109] VGAM868 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12110] An enzyme complex designated DICER COMPLEX, dices the VGAM868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM868 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM868 RNA is designated SEQ ID:3579, and is provided hereinbelow with reference to the sequence listing part.

[12111] VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12112] VGAM868 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM868 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM868 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12113] The complementary binding of VGAM868 RNA, herein designated VGAM RNA, to host target binding sites on VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM868 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM868 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12114] It is appreciated that VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM868 host target genes. The mRNA of each one of this plurality of VGAM868 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM868 RNA, herein designated VGAM RNA, and which when bound by VGAM868 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM868 host target proteins.

[12115] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM868 gene, herein designated VGAM GENE, on one or more VGAM868 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12116] It is yet further appreciated that a function of VGAM868 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM868 include diagnosis, prevention and treatment of viral infection by turkey adenovirus 3. Specific functions, and accordingly utilities, of VGAM868 correlate with, and may be deduced from, the identity of the host target genes which VGAM868 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12117] Nucleotide sequences of the VGAM868 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM868 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM868 are further de-

scribed hereinbelow with reference to Table 1.

[12118] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM868 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12119] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 869 (VGAM869) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12120] VGAM869 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM869 was detected is described hereinabove with reference to Figs. 2-8.

[12121] VGAM869 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12122] VGAM869 gene, herein designated VGAM GENE, encodes a VGAM869 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM869 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM869 precursor RNA is designated SEQ ID:855, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:855 is located at position 174898 relative to the genome of Fowlpox virus.

[12123] VGAM869 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12124] An enzyme complex designated DICER COMPLEX, dices the VGAM869 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM869 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM869 RNA is designated SEQ ID:3580, and is provided hereinbelow with reference to the sequence listing part.

[12125] VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12126] VGAM869 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM869 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM869 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12127] The complementary binding of VGAM869 RNA, herein designated VGAM RNA, to host target binding sites on VGAM869 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM869 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM869 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12128] It is appreciated that VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM869 host target genes. The mRNA of each one of this plurality of VGAM869 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM869 RNA, herein designated VGAM RNA, and which when bound by VGAM869 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM869 host target proteins.

[12129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM869 gene, herein designated VGAM GENE, on one or more VGAM869 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12130] It is yet further appreciated that a function of VGAM869 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM869 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM869 correlate with, and may be deduced from, the identity of the host target genes which VGAM869 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12131] Nucleotide sequences of the VGAM869 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM869 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM869 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM869 are further described hereinbelow with reference to Table 1.

[12132] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM869 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12133] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 870 (VGAM870) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12134] VGAM870 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM870 was detected is described hereinabove with reference to Figs. 2-8.

[12135] VGAM870 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[12136] VGAM870 gene, herein designated VGAM GENE, encodes a VGAM870 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM870 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM870 precursor RNA is designated SEQ ID:856, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:856 is located at position 175174 relative to the genome of Fowlpox virus.

[12137] VGAM870 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12138] An enzyme complex designated DICER COMPLEX, dices

the VGAM870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM870 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM870 RNA is designated SEQ ID:3581, and is provided hereinbelow with reference to the sequence listing part.

[12139] VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12140] VGAM870 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM870 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM870 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM870 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12141] The complementary binding of VGAM870 RNA, herein designated VGAM RNA, to host target binding sites on VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM870 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM870 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12142] It is appreciated that VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM870 host target genes. The mRNA of each one of this plurality of VGAM870 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM870 RNA, herein designated VGAM RNA, and which when bound by VGAM870 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM870 host target proteins.

[12143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM870 gene, herein designated VGAM GENE, on one or more VGAM870 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12144] It is yet further appreciated that a function of VGAM870 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM870 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM870 correlate with, and may be deduced from, the identity of the host target genes which VGAM870 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12145] Nucleotide sequences of the VGAM870 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM870 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM870 are further described hereinbelow with reference to Table 1.

[12146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM870 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12147] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 871 (VGAM871) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12148] VGAM871 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM871 was detected is described hereinabove with reference to Figs. 2-8.

[12149] VGAM871 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM871 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[12150] VGAM871 gene, herein designated VGAM GENE, encodes a VGAM871 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM871 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM871 precursor RNA is designated SEQ ID:857, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:857 is located at position 172281 relative to the genome of Fowlpox virus.

[12151] VGAM871 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12152] An enzyme complex designated DICER COMPLEX, dices the VGAM871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM871 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM871 RNA is designated SEQ ID:3582, and is provided hereinbelow with reference to the sequence listing part.

[12153] VGAM871 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12154] VGAM871 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM871 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM871 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12155] The complementary binding of VGAM871 RNA, herein designated VGAM RNA, to host target binding sites on VGAM871 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM871 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM871 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12156] It is appreciated that VGAM871 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM871 host target genes. The mRNA of each one of this plurality of VGAM871 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM871 RNA, herein designated VGAM RNA, and which when bound by VGAM871 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM871 host target proteins.

[12157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM871 gene, herein designated VGAM GENE, on one or more VGAM871 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12158] It is yet further appreciated that a function of VGAM871 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM871 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM871 correlate with, and may be deduced from, the identity of the host target genes which VGAM871 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12159] Nucleotide sequences of the VGAM871 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM871 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM871 are further described hereinbelow with reference to Table 1.

[12160] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM871 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12161] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 872 (VGAM872) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12162] VGAM872 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM872 was detected is described hereinabove with reference to Figs. 2-8.

[12163] VGAM872 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM872 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12164] VGAM872 gene, herein designated VGAM GENE, encodes a VGAM872 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM872 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM872 precursor RNA is designated SEQ ID:858, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:858 is located at position 172697 relative to the genome of Fowlpox virus.

[12165] VGAM872 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[12166] An enzyme complex designated DICER COMPLEX, dices the VGAM872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM872 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM872 RNA is designated SEQ ID:3583, and is provided hereinbelow with reference to the sequence listing part.

[12167] VGAM872 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12168] VGAM872 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM872 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM872 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12169] The complementary binding of VGAM872 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM872 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM872 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12170] It is appreciated that VGAM872 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM872 host target genes. The mRNA of each one of this plurality of VGAM872 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM872 RNA, herein designated VGAM RNA, and which when bound by VGAM872 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM872 host target proteins.

[12171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM872 gene, herein designated VGAM GENE, on one or more VGAM872 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12172] It is yet further appreciated that a function of VGAM872 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM872 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM872 correlate with, and may be deduced from, the identity of the host target genes which VGAM872 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12173] Nucleotide sequences of the VGAM872 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM872 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM872 are further described hereinbelow with reference to Table 1.

[12174] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM872 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12175] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 873 (VGAM873) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12176] VGAM873 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM873 was detected is described hereinabove with reference to Figs. 2-8.

[12177] VGAM873 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Fowlpox virus.

VGAM873 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12178] VGAM873 gene, herein designated VGAM GENE, encodes a VGAM873 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM873 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM873 precursor RNA is designated SEQ ID:859, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:859 is located at position 174514 relative to the genome of Fowlpox virus.

[12179] VGAM873 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12180] An enzyme complex designated DICER COMPLEX, dices the VGAM873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM873 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM873 RNA is designated SEQ ID:3584, and is provided hereinbelow with reference to the sequence listing part.

[12181] VGAM873 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12182] VGAM873 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM873 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM873 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12183] The complementary binding of VGAM873 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM873 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM873 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12184] It is appreciated that VGAM873 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM873 host target genes. The mRNA of each one of this plurality of VGAM873 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM873 RNA, herein designated VGAM RNA, and which when bound by VGAM873 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM873 host target proteins.

[12185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM873 gene, herein designated VGAM GENE, on one or more VGAM873 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12186] It is yet further appreciated that a function of VGAM873 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM873 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM873 correlate with, and may be deduced from, the identity of the host target genes which VGAM873 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12187] Nucleotide sequences of the VGAM873 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM873 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM873 are further described hereinbelow with reference to Table 1.

[12188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM873 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12189] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 874 (VGAM874) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12190] VGAM874 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM874 was detected is described hereinabove with reference to Figs. 2-8.

[12191] VGAM874 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM874 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12192] VGAM874 gene, herein designated VGAM GENE, encodes a VGAM874 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM874 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM874 precursor RNA is designated SEQ ID:860, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:860 is located at position 91946 relative to the genome of Swinepox virus.

[12193] VGAM874 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12194] An enzyme complex designated DICER COMPLEX, dices the VGAM874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM874 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM874 RNA is designated SEQ ID:3585, and is provided hereinbelow with reference to the sequence listing part.

[12195] VGAM874 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[12196] VGAM874 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM874 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM874 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12197] The complementary binding of VGAM874 RNA, herein designated VGAM RNA, to host target binding sites on VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM874 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM874 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12198] It is appreciated that VGAM874 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM874 host target genes. The mRNA of each one of this plurality of VGAM874 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM874 RNA, herein designated VGAM RNA, and which when bound by VGAM874 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM874 host target proteins.

[12199] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM874 gene, herein designated VGAM GENE, on one or

more VGAM874 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12200] It is yet further appreciated that a function of VGAM874 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM874 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM874 correlate with, and may be deduced from, the identity of the host target genes which VGAM874 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12201] Nucleotide sequences of the VGAM874 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM874 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM874 are further described hereinbelow with reference to Table 1.

[12202] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM874 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12203] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 875 (VGAM875) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12204] VGAM875 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM875 was detected is described

hereinabove with reference to Figs. 2–8.

[12205] VGAM875 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM875 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12206] VGAM875 gene, herein designated VGAM GENE, encodes a VGAM875 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM875 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM875 precursor RNA is designated SEQ ID:861, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:861 is located at position 28481 relative to the genome of Human herpesvirus 5.

[12207] VGAM875 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12208] An enzyme complex designated DICER COMPLEX, dices the VGAM875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM875 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM875 RNA is designated SEQ ID:3586, and is provided hereinbelow with reference to the sequence listing part.

[12209] VGAM875 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12210] VGAM875 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM875 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM875 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[12211] The complementary binding of VGAM875 RNA, herein designated VGAM RNA, to host target binding sites on VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM875 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM875 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12212] It is appreciated that VGAM875 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM875 host target genes. The mRNA of each one of this plurality of VGAM875 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM875 RNA, herein designated VGAM RNA, and which when bound by VGAM875 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM875 host target proteins.

[12213] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM875 gene, herein designated VGAM GENE, on one or more VGAM875 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12214] It is yet further appreciated that a function of VGAM875 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM875 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM875 correlate with, and may be deduced from, the identity of the host target genes which VGAM875 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[12215] Nucleotide sequences of the VGAM875 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM875 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM875 are further described hereinbelow with reference to Table 1.

[12216] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM875 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12217] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 876 (VGAM876) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12218] VGAM876 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM876 was detected is described hereinabove with reference to Figs. 2–8.

[12219] VGAM876 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5.

VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12220] VGAM876 gene, herein designated VGAM GENE, encodes a VGAM876 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM876 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM876 precursor RNA is designated SEQ ID:862, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:862 is located at position 29679 relative to the genome of Human herpesvirus 5.

[12221] VGAM876 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12222] An enzyme complex designated DICER COMPLEX, dices the VGAM876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM876 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM876 RNA is designated SEQ ID:3587, and is provided hereinbelow with reference to the sequence listing part.

[12223] VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12224] VGAM876 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM876 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM876 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12225] The complementary binding of VGAM876 RNA, herein designated VGAM RNA, to host target binding sites on VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM876 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM876 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12226] It is appreciated that VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM876 host target genes. The mRNA of each one of this plurality of VGAM876 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM876 RNA, herein designated VGAM RNA, and which when bound by VGAM876 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM876 host target proteins.

[12227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM876 gene, herein designated VGAM GENE, on one or more VGAM876 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12228] It is yet further appreciated that a function of VGAM876 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM876 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM876 correlate with, and may be deduced from, the identity of the host target genes which VGAM876 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[12229] Nucleotide sequences of the VGAM876 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM876 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM876 are further described hereinbelow with reference to Table 1.

[12230] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM876 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12231] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 877 (VGAM877) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12232] VGAM877 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM877 was detected is described hereinabove with reference to Figs. 2–8.

[12233] VGAM877 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM877 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12234] VGAM877 gene, herein designated VGAM GENE, encodes a VGAM877 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM877 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM877 precursor RNA is designated SEQ ID:863, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:863 is located at position 27633 relative to the genome of Human herpesvirus 5.

[12235] VGAM877 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12236] An enzyme complex designated DICER COMPLEX, dices the VGAM877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM877 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM877 RNA is designated SEQ ID:3588, and is provided hereinbelow with reference to the sequence listing part.

[12237] VGAM877 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12238] VGAM877 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM877 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM877 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12239] The complementary binding of VGAM877 RNA, herein designated VGAM RNA, to host target binding sites on VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM877 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM877 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12240] It is appreciated that VGAM877 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM877 host target genes. The mRNA of each one of this plurality of VGAM877 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM877 RNA, herein designated VGAM RNA, and which when bound by VGAM877 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM877 host target proteins.

[12241] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM877 gene, herein designated VGAM GENE, on one or more VGAM877 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12242] It is yet further appreciated that a function of VGAM877 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM877 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM877 correlate with, and may be deduced from, the identity of the

host target genes which VGAM877 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12243] Nucleotide sequences of the VGAM877 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM877 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM877 are further described hereinbelow with reference to Table 1.

[12244] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM877 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12245] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 878 (VGAM878) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12246] VGAM878 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM878 was detected is described hereinabove with reference to Figs. 2–8.

[12247] VGAM878 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM878 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12248] VGAM878 gene, herein designated VGAM GENE, encodes a VGAM878 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM878 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM878 precursor RNA is designated SEQ ID:864, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:864 is located at position 106591 relative to the genome of Swinepox virus.

[12249] VGAM878 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12250] An enzyme complex designated DICER COMPLEX, dices the VGAM878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM878 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM878 RNA is designated SEQ ID:3589, and is provided hereinbelow with reference to the sequence listing part.

[12251] VGAM878 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[12252] VGAM878 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM878 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM878 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12253] The complementary binding of VGAM878 RNA, herein designated VGAM RNA, to host target binding sites on VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM878 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM878 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12254] It is appreciated that VGAM878 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM878 host target genes. The mRNA of each one of this plurality of VGAM878 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM878 RNA, herein designated VGAM RNA, and which when bound by VGAM878 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM878 host target proteins.

[12255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM878 gene, herein designated VGAM GENE, on one or

more VGAM878 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12256] It is yet further appreciated that a function of VGAM878 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM878 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM878 correlate with, and may be deduced from, the identity of the host target genes which VGAM878 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12257] Nucleotide sequences of the VGAM878 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM878 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM878 are further described hereinbelow with reference to Table 1.

[12258] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM878 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12259] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 879 (VGAM879) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12260] VGAM879 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM879 was detected is described

hereinabove with reference to Figs. 2–8.

[12261] VGAM879 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12262] VGAM879 gene, herein designated VGAM GENE, encodes a VGAM879 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM879 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM879 precursor RNA is designated SEQ ID:865, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:865 is located at position 137324 relative to the genome of Amsacta moorei entomopoxvirus.

[12263] VGAM879 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12264] An enzyme complex designated DICER COMPLEX, dices the VGAM879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM879 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM879 RNA is designated SEQ ID:3590, and is provided hereinbelow with reference to the sequence listing part.

[12265] VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12266] VGAM879 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM879 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM879 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[12267] The complementary binding of VGAM879 RNA, herein designated VGAM RNA, to host target binding sites on VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM879 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM879 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12268] It is appreciated that VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM879 host target genes. The mRNA of each one of this plurality of VGAM879 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM879 RNA, herein designated VGAM RNA, and which when bound by VGAM879 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM879 host target proteins.

[12269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM879 gene, herein designated VGAM GENE, on one or more VGAM879 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12270] It is yet further appreciated that a function of VGAM879 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM879 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM879 correlate with, and may be deduced from, the identity of the host target genes which VGAM879 binds and inhibits, and the function of these host target

genes, as elaborated hereinbelow.

[12271] Nucleotide sequences of the VGAM879 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM879 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM879 are further described hereinbelow with reference to Table 1.

[12272] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM879 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12273] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 880 (VGAM880) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12274] VGAM880 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM880 was detected is described hereinabove with reference to Figs. 2–8.

[12275] VGAM880 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3.

VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12276] VGAM880 gene, herein designated VGAM GENE, encodes a VGAM880 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM880 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM880 precursor RNA is designated SEQ ID:866, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:866 is located at position 52351 relative to the genome of Gallid herpesvirus 3.

[12277] VGAM880 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12278] An enzyme complex designated DICER COMPLEX, dices the VGAM880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM880 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM880 RNA is designated SEQ ID:3591, and is provided hereinbelow with reference to the sequence listing part.

[12279] VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12280] VGAM880 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM880 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM880 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12281] The complementary binding of VGAM880 RNA, herein designated VGAM RNA, to host target binding sites on VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM880 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM880 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12282] It is appreciated that VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM880 host target genes. The mRNA of each one of this plurality of VGAM880 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM880 RNA, herein designated VGAM RNA, and which when bound by VGAM880 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM880 host target proteins.

[12283] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM880 gene, herein designated VGAM GENE, on one or more VGAM880 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12284] It is yet further appreciated that a function of VGAM880 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM880 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM880 correlate with, and may be deduced from, the identity of the host target genes which VGAM880 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[12285] Nucleotide sequences of the VGAM880 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM880 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM880 are further described hereinbelow with reference to Table 1.

[12286] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM880 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12287] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 881 (VGAM881) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12288] VGAM881 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM881 was detected is described hereinabove with reference to Figs. 2–8.

[12289] VGAM881 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12290] VGAM881 gene, herein designated VGAM GENE, encodes a VGAM881 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM881 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM881 precursor RNA is designated SEQ ID:867, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:867 is located at position 51459 relative to the genome of Gallid herpesvirus 3.

[12291] VGAM881 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12292] An enzyme complex designated DICER COMPLEX, dices the VGAM881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM881 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM881 RNA is designated SEQ ID:3592, and is provided hereinbelow with reference to the sequence listing part.

[12293] VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12294] VGAM881 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM881 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM881 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12295] The complementary binding of VGAM881 RNA, herein designated VGAM RNA, to host target binding sites on VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM881 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM881 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12296] It is appreciated that VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM881 host target genes. The mRNA of each one of this plurality of VGAM881 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM881 RNA, herein designated VGAM RNA, and which when bound by VGAM881 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM881 host target proteins.

[12297] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM881 gene, herein designated VGAM GENE, on one or more VGAM881 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12298] It is yet further appreciated that a function of VGAM881 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM881 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM881 correlate with, and may be deduced from, the identity of the

host target genes which VGAM881 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12299] Nucleotide sequences of the VGAM881 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM881 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM881 are further described hereinbelow with reference to Table 1.

[12300] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM881 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12301] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 882 (VGAM882) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12302] VGAM882 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM882 was detected is described hereinabove with reference to Figs. 2–8.

[12303] VGAM882 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12304] VGAM882 gene, herein designated VGAM GENE, encodes a VGAM882 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM882 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM882 precursor RNA is designated SEQ ID:868, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:868 is located at position 13598 relative to the genome of Meleagrid herpesvirus 1.

[12305] VGAM882 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM882 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12306] An enzyme complex designated DICER COMPLEX, dices the VGAM882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM882 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM882 RNA is designated SEQ ID:3593, and is provided hereinbelow with reference to the sequence listing part.

[12307] VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM882 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12308] VGAM882 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM882 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM882 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12309] The complementary binding of VGAM882 RNA, herein designated VGAM RNA, to host target binding sites on VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM882 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM882 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12310] It is appreciated that VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM882 host target genes. The mRNA of each one of this plurality of VGAM882 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM882 RNA, herein designated VGAM RNA, and which when bound by VGAM882 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM882 host target proteins.

[12311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM882 gene, herein designated VGAM GENE, on one or more VGAM882 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12312] It is yet further appreciated that a function of VGAM882 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM882 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM882

correlate with, and may be deduced from, the identity of the host target genes which VGAM882 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12313] Nucleotide sequences of the VGAM882 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM882 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM882 are further described hereinbelow with reference to Table 1.

[12314] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM882 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12315] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 883 (VGAM883) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[12316] VGAM883 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM883 was detected is described hereinabove with reference to Figs. 2–8.

[12317] VGAM883 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM883 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12318] VGAM883 gene, herein designated VGAM GENE, encodes a VGAM883 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM883 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM883 precursor RNA is designated SEQ ID:869, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:869 is located at position 33063 relative to the genome of Gallid herpesvirus 3.

[12319] VGAM883 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM883 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12320] An enzyme complex designated DICER COMPLEX, dices the VGAM883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM883 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM883 RNA is designated SEQ ID:3594, and is provided hereinbelow with reference to the sequence listing part.

[12321] VGAM883 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM883 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12322] VGAM883 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM883 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM883 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12323] The complementary binding of VGAM883 RNA, herein designated VGAM RNA, to host target binding sites on VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM883 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM883 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12324] It is appreciated that VGAM883 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM883 host target genes. The mRNA of each one of this plurality of VGAM883 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM883 RNA, herein designated VGAM RNA, and which when bound by VGAM883 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM883 host target proteins.

[12325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM883 gene, herein designated VGAM GENE, on one or more VGAM883 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12326] It is yet further appreciated that a function of VGAM883 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM883 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Spe-

cific functions, and accordingly utilities, of VGAM883 correlate with, and may be deduced from, the identity of the host target genes which VGAM883 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [12327] Nucleotide sequences of the VGAM883 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM883 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM883 are further described hereinbelow with reference to Table 1.
- [12328] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM883 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [12329] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 884 (VGAM884) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[12330] VGAM884 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM884 was detected is described hereinabove with reference to Figs. 2–8.

[12331] VGAM884 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12332] VGAM884 gene, herein designated VGAM GENE, encodes a VGAM884 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM884 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM884 precursor RNA is designated SEQ ID:870, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:870 is located at position 93181 relative to the genome of Rat cytomegalovirus.

[12333] VGAM884 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12334] An enzyme complex designated DICER COMPLEX, dices the VGAM884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM884 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM884 RNA is designated SEQ ID:3595, and is provided hereinbelow with reference to the sequence listing part.

[12335] VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12336] VGAM884 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM884 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM884 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM884 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12337] The complementary binding of VGAM884 RNA, herein designated VGAM RNA, to host target binding sites on VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM884 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM884 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12338] It is appreciated that VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM884 host target genes. The mRNA of each one of this plurality of VGAM884 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM884 RNA, herein designated VGAM RNA, and which when bound by VGAM884 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM884 host target proteins.

[12339] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM884 gene, herein designated VGAM GENE, on one or more VGAM884 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12340] It is yet further appreciated that a function of VGAM884 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM884 include diagnosis, prevention and

treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM884 correlate with, and may be deduced from, the identity of the host target genes which VGAM884 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12341] Nucleotide sequences of the VGAM884 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM884 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM884 are further described hereinbelow with reference to Table 1.

[12342] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM884 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12343] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 885 (VGAM885) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12344] VGAM885 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM885 was detected is described hereinabove with reference to Figs. 2–8.

[12345] VGAM885 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus E. VGAM885 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12346] VGAM885 gene, herein designated VGAM GENE, encodes a VGAM885 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM885 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM885 precursor RNA is designated SEQ ID:871, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:871 is located at position 7211 relative to the genome of Human adenovirus E.

[12347] VGAM885 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12348] An enzyme complex designated DICER COMPLEX, dices the VGAM885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM885 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM885 RNA is designated SEQ ID:3596, and is provided hereinbelow with reference to the sequence listing part.

[12349] VGAM885 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12350] VGAM885 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM885 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM885 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12351] The complementary binding of VGAM885 RNA, herein designated VGAM RNA, to host target binding sites on VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM885 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM885 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12352] It is appreciated that VGAM885 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM885 host target genes. The mRNA of each one of this plurality of VGAM885 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM885 RNA, herein designated VGAM

RNA, and which when bound by VGAM885 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM885 host target proteins.

[12353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM885 gene, herein designated VGAM GENE, on one or more VGAM885 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12354] It is yet further appreciated that a function of VGAM885 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM885 include diagnosis, prevention and treatment of viral infection by Human adenovirus E. Specific functions, and accordingly utilities, of VGAM885 correlate with, and may be deduced from, the identity of the host target genes which VGAM885 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12355] Nucleotide sequences of the VGAM885 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM885 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM885 are further described hereinbelow with reference to Table 1.

[12356] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM885 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12357] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 886 (VGAM886) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12358] VGAM886 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM886 was detected is described hereinabove with reference to Figs. 2–8.

[12359] VGAM886 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM886 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12360] VGAM886 gene, herein designated VGAM GENE, encodes a VGAM886 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM886 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM886 precursor RNA is designated SEQ ID:872, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:872 is located at position 68429 relative to the genome of Vaccinia virus.

[12361] VGAM886 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12362] An enzyme complex designated DICER COMPLEX, dices the VGAM886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM886 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM886 RNA is designated SEQ ID:3597, and is provided hereinbelow with reference to the sequence listing part.

[12363] VGAM886 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12364] VGAM886 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM886 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM886 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12365] The complementary binding of VGAM886 RNA, herein designated VGAM RNA, to host target binding sites on VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM886 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM886 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12366] It is appreciated that VGAM886 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM886 host target genes. The mRNA of each one of this plurality of VGAM886 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM886 RNA, herein designated VGAM

RNA, and which when bound by VGAM886 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM886 host target proteins.

[12367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM886 gene, herein designated VGAM GENE, on one or more VGAM886 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12368] It is yet further appreciated that a function of VGAM886 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM886 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM886 correlate with, and may be deduced from, the identity of the host target genes which VGAM886 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12369] Nucleotide sequences of the VGAM886 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM886 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM886 are further described hereinbelow with reference to Table 1.

[12370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM886 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12371] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 887 (VGAM887) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12372] VGAM887 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM887 was detected is described hereinabove with reference to Figs. 2–8.

[12373] VGAM887 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM887 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12374] VGAM887 gene, herein designated VGAM GENE, encodes a VGAM887 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM887 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM887 precursor RNA is designated SEQ ID:873, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:873 is located at position 67126 relative to the genome of Vaccinia virus.

[12375] VGAM887 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12376] An enzyme complex designated DICER COMPLEX, dices the VGAM887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM887 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM887 RNA is designated SEQ ID:3598, and is provided hereinbelow with reference to the sequence listing part.

[12377] VGAM887 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12378] VGAM887 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM887 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM887 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12379] The complementary binding of VGAM887 RNA, herein designated VGAM RNA, to host target binding sites on VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM887 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM887 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12380] It is appreciated that VGAM887 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM887 host target genes. The mRNA of each one of this plurality of VGAM887 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM887 RNA, herein designated VGAM

RNA, and which when bound by VGAM887 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM887 host target proteins.

[12381] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM887 gene, herein designated VGAM GENE, on one or more VGAM887 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12382] It is yet further appreciated that a function of VGAM887 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM887 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM887 correlate with, and may be deduced from, the identity of the host target genes which VGAM887 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12383] Nucleotide sequences of the VGAM887 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM887 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM887 are further described hereinbelow with reference to Table 1.

[12384] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM887 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12385] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 888 (VGAM888) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12386] VGAM888 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM888 was detected is described hereinabove with reference to Figs. 2–8.

[12387] VGAM888 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12388] VGAM888 gene, herein designated VGAM GENE, encodes a VGAM888 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM888 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM888 precursor RNA is designated SEQ ID:874, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:874 is located at position 7588 relative to

the genome of Human herpesvirus 4.

[12389] VGAM888 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12390] An enzyme complex designated DICER COMPLEX, dices the VGAM888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM888 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM888 RNA is designated SEQ ID:3599, and is provided hereinbelow with reference to the sequence listing part.

[12391] VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12392] VGAM888 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM888 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM888 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12393] The complementary binding of VGAM888 RNA, herein designated VGAM RNA, to host target binding sites on VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM888 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM888 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12394] It is appreciated that VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM888 host target genes. The mRNA of each one of this plurality of VGAM888 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM888 RNA, herein designated VGAM RNA, and which when bound by VGAM888 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM888 host target proteins.

[12395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM888 gene, herein designated VGAM GENE, on one or more VGAM888 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12396] It is yet further appreciated that a function of VGAM888 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM888 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM888 correlate with, and may be deduced from, the identity of the host target genes which VGAM888 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12397] Nucleotide sequences of the VGAM888 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM888 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM888 are further described hereinbelow with reference to Table 1.

[12398] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM888 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12399] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 889 (VGAM889) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12400] VGAM889 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM889 was detected is described hereinabove with reference to Figs. 2–8.

[12401] VGAM889 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12402] VGAM889 gene, herein designated VGAM GENE, encodes a VGAM889 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM889 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM889 precursor RNA is designated SEQ ID:875, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:875 is located at position 9562 relative to the genome of Human herpesvirus 4.

[12403] VGAM889 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12404] An enzyme complex designated DICER COMPLEX, dices the VGAM889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM889 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM889 RNA is designated SEQ ID:3600, and is provided hereinbelow with reference to the sequence

listing part.

[12405] VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12406] VGAM889 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM889 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM889 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12407] The complementary binding of VGAM889 RNA, herein designated VGAM RNA, to host target binding sites on VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM889 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM889 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12408] It is appreciated that VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM889 host target genes. The mRNA of each one of this plurality of VGAM889 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM889 RNA, herein designated VGAM RNA, and which when bound by VGAM889 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM889 host target proteins.

[12409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM889 gene, herein designated VGAM GENE, on one or more VGAM889 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12410] It is yet further appreciated that a function of VGAM889 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM889 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM889 correlate with, and may be deduced from, the identity of the host target genes which VGAM889 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12411] Nucleotide sequences of the VGAM889 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM889 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM889 are further described hereinbelow with reference to Table 1.

[12412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM889 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12413] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 890 (VGAM890) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12414] VGAM890 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM890 was detected is described hereinabove with reference to Figs. 2–8.

[12415] VGAM890 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM890 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12416] VGAM890 gene, herein designated VGAM GENE, encodes a VGAM890 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM890 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM890 precursor RNA is designated SEQ ID:876, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:876 is located at position 8059 relative to the genome of Human herpesvirus 4.

[12417] VGAM890 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12418] An enzyme complex designated DICER COMPLEX, dices the VGAM890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM890 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM890 RNA is designated SEQ ID:3601, and

is provided hereinbelow with reference to the sequence listing part.

[12419] VGAM890 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12420] VGAM890 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM890 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM890 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12421] The complementary binding of VGAM890 RNA, herein designated VGAM RNA, to host target binding sites on VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM890 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM890 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12422] It is appreciated that VGAM890 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM890 host target genes. The mRNA of each one of this plurality of VGAM890 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM890 RNA, herein designated VGAM RNA, and which when bound by VGAM890 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM890 host target proteins.

[12423] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM890 gene, herein designated VGAM GENE, on one or more VGAM890 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12424] It is yet further appreciated that a function of VGAM890 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM890 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM890 correlate with, and may be deduced from, the identity of the host target genes which VGAM890 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12425] Nucleotide sequences of the VGAM890 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM890 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM890 are further described hereinbelow with reference to Table 1.

[12426] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM890 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12427] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 891 (VGAM891) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12428] VGAM891 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM891 was detected is described hereinabove with reference to Figs. 2–8.

[12429] VGAM891 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12430] VGAM891 gene, herein designated VGAM GENE, encodes a VGAM891 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM891 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM891 precursor RNA is

designated SEQ ID:877, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:877 is located at position 7900 relative to the genome of Human herpesvirus 4.

[12431] VGAM891 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12432] An enzyme complex designated DICER COMPLEX, dices the VGAM891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM891 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide se-

quence of VGAM891 RNA is designated SEQ ID:3602, and is provided hereinbelow with reference to the sequence listing part.

[12433] VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12434] VGAM891 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM891 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM891 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12435] The complementary binding of VGAM891 RNA, herein designated VGAM RNA, to host target binding sites on VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM891 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM891 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12436] It is appreciated that VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM891 host target genes. The mRNA of

each one of this plurality of VGAM891 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM891 RNA, herein designated VGAM RNA, and which when bound by VGAM891 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM891 host target proteins.

[12437] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM891 gene, herein designated VGAM GENE, on one or more VGAM891 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[12438] It is yet further appreciated that a function of VGAM891 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM891 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM891 correlate with, and may be deduced from, the identity of the host target genes which VGAM891 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12439] Nucleotide sequences of the VGAM891 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM891 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM891 are further described hereinbelow with reference to Table 1.

[12440] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM891 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[12441] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 892 (VGAM892) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12442] VGAM892 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM892 was detected is described hereinabove with reference to Figs. 2–8.

[12443] VGAM892 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Periplaneta fuliginosa* densovirus. VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12444] VGAM892 gene, herein designated VGAM GENE, encodes a VGAM892 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM892 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM892 precursor RNA is designated SEQ ID:878, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:878 is located at position 4066 relative to the genome of *Periplaneta fuliginosa* densovirus.

[12445] VGAM892 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12446] An enzyme complex designated DICER COMPLEX, dices the VGAM892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM892 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 74%) nucleotide sequence of VGAM892 RNA is designated SEQ ID:3603, and is provided hereinbelow with reference to the sequence listing part.

[12447] VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12448] VGAM892 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM892 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM892 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12449] The complementary binding of VGAM892 RNA, herein designated VGAM RNA, to host target binding sites on VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM892 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM892 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12450] It is appreciated that VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM892 host target genes. The mRNA of each one of this plurality of VGAM892 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM892 RNA, herein designated VGAM RNA, and which when bound by VGAM892 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM892 host target proteins.

[12451] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM892 gene, herein designated VGAM GENE, on one or more VGAM892 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[12452] It is yet further appreciated that a function of VGAM892 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM892 include diagnosis, prevention and treatment of viral infection by *Periplaneta fuliginosa* densovirus. Specific functions, and accordingly utilities, of VGAM892 correlate with, and may be deduced from, the identity of the host target genes which VGAM892 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12453] Nucleotide sequences of the VGAM892 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM892 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM892 are further described hereinbelow with reference to Table 1.

[12454] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM892 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12455] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 893 (VGAM893) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12456] VGAM893 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM893 was detected is described hereinabove with reference to Figs. 2–8.

[12457] VGAM893 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Periplaneta fuliginosa* densovirus. VGAM893 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12458] VGAM893 gene, herein designated VGAM GENE, encodes a VGAM893 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM893 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM893 precursor RNA is designated SEQ ID:879, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:879 is located at position 2 relative to the genome of *Periplaneta fuliginosa* densovirus.

[12459] VGAM893 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12460] An enzyme complex designated DICER COMPLEX, dices the VGAM893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM893 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM893 RNA is designated SEQ ID:3604, and is provided hereinbelow with reference to the sequence listing part.

[12461] VGAM893 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12462] VGAM893 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM893 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM893 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12463] The complementary binding of VGAM893 RNA, herein designated VGAM RNA, to host target binding sites on VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM893 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM893 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12464] It is appreciated that VGAM893 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM893 host target genes. The mRNA of each one of this plurality of VGAM893 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM893 RNA, herein designated VGAM RNA, and which when bound by VGAM893 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM893 host target proteins.

[12465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM893 gene, herein designated VGAM GENE, on one or more VGAM893 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12466] It is yet further appreciated that a function of VGAM893 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM893 include diagnosis, prevention and treatment of viral infection by *Periplaneta fuliginosa* densovirus. Specific functions, and accordingly utilities, of VGAM893 correlate with, and may be deduced from, the identity of the host target genes which VGAM893 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12467] Nucleotide sequences of the VGAM893 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM893 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM893 are further described hereinbelow with reference to Table 1.

[12468] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM893 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12469] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 894 (VGAM894) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12470] VGAM894 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM894 was detected is described hereinabove with reference to Figs. 2–8.

[12471] VGAM894 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Periplaneta fuliginosa* densovirus. VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12472] VGAM894 gene, herein designated VGAM GENE, encodes a VGAM894 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM894 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM894 precursor RNA is designated SEQ ID:880, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:880 is located at position 2107 relative to the genome of *Periplaneta fuliginosa* densovirus.

[12473] VGAM894 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12474] An enzyme complex designated DICER COMPLEX, dices the VGAM894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM894 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM894 RNA is designated SEQ ID:3605, and is provided hereinbelow with reference to the sequence listing part.

[12475] VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12476] VGAM894 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM894 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM894 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12477] The complementary binding of VGAM894 RNA, herein designated VGAM RNA, to host target binding sites on VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM894 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM894 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12478] It is appreciated that VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM894 host target genes. The mRNA of each one of this plurality of VGAM894 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM894 RNA, herein designated VGAM RNA, and which when bound by VGAM894 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM894 host target proteins.

[12479] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM894 gene, herein designated VGAM GENE, on one or more VGAM894 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12480] It is yet further appreciated that a function of VGAM894 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM894 include diagnosis, prevention and treatment of viral infection by *Periplaneta fuliginosa* densovirus. Specific functions, and accordingly utilities, of VGAM894 correlate with, and may be deduced from, the identity of the host target genes which VGAM894 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12481] Nucleotide sequences of the VGAM894 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM894 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM894 are further described hereinbelow with reference to Table 1.

[12482] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM894 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12483] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 895 (VGAM895) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12484] VGAM895 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM895 was detected is described hereinabove with reference to Figs. 2–8.

[12485] VGAM895 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12486] VGAM895 gene, herein designated VGAM GENE, encodes a VGAM895 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM895 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM895 precursor RNA is designated SEQ ID:881, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:881 is located at position 20248 relative to the genome of Gallid herpesvirus 2.

[12487] VGAM895 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12488] An enzyme complex designated DICER COMPLEX, dices the VGAM895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM895 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM895 RNA is designated SEQ ID:3606, and is provided hereinbelow with reference to the sequence listing part.

[12489] VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12490] VGAM895 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM895 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM895 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12491] The complementary binding of VGAM895 RNA, herein designated VGAM RNA, to host target binding sites on VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM895 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM895 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[12492] It is appreciated that VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM895 host target genes. The mRNA of each one of this plurality of VGAM895 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM895 RNA, herein designated VGAM RNA, and which when bound by VGAM895 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM895 host target proteins.

[12493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM895 gene, herein designated VGAM GENE, on one or more VGAM895 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12494] It is yet further appreciated that a function of VGAM895 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM895 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM895 correlate with, and may be deduced from, the identity of the host target genes which VGAM895 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12495] Nucleotide sequences of the VGAM895 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM895 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM895 are further described hereinbelow with reference to Table 1.

[12496] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM895 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12497] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 896 (VGAM896) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12498] VGAM896 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM896 was detected is described hereinabove with reference to Figs. 2-8.

[12499] VGAM896 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12500] VGAM896 gene, herein designated VGAM GENE, encodes a VGAM896 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM896 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM896 precursor RNA is designated SEQ ID:882, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:882 is located at position 21611 relative to the genome of Gallid herpesvirus 2.

[12501] VGAM896 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12502] An enzyme complex designated DICER COMPLEX, dices the VGAM896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM896 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM896 RNA is designated SEQ ID:3607, and is provided hereinbelow with reference to the sequence listing part.

[12503] VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12504] VGAM896 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM896 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM896 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12505] The complementary binding of VGAM896 RNA, herein designated VGAM RNA, to host target binding sites on VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM896 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM896 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12506] It is appreciated that VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM896 host target genes. The mRNA of each one of this plurality of VGAM896 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM896 RNA, herein designated VGAM RNA, and which when bound by VGAM896 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM896 host target proteins.

[12507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM896 gene, herein designated VGAM GENE, on one or more VGAM896 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12508] It is yet further appreciated that a function of VGAM896 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM896 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM896 correlate with, and may be deduced from, the identity of the host target genes which VGAM896 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12509] Nucleotide sequences of the VGAM896 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM896 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM896 are further described hereinbelow with reference to Table 1.

[12510] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM896 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12511] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 897 (VGAM897) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12512] VGAM897 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM897 was detected is described hereinabove with reference to Figs. 2-8.

[12513] VGAM897 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM897 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12514] VGAM897 gene, herein designated VGAM GENE, encodes a

VGAM897 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM897 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM897 precursor RNA is designated SEQ ID:883, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:883 is located at position 20974 relative to the genome of Gallid herpesvirus 2.

[12515] VGAM897 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12516] An enzyme complex designated DICER COMPLEX, dices the VGAM897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM897 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM897 RNA is designated SEQ ID:3608, and is provided hereinbelow with reference to the sequence listing part.

[12517] VGAM897 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12518] VGAM897 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM897 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM897 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12519] The complementary binding of VGAM897 RNA, herein designated VGAM RNA, to host target binding sites on VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM897 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM897 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12520] It is appreciated that VGAM897 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM897 host target genes. The mRNA of each one of this plurality of VGAM897 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM897 RNA, herein designated VGAM RNA, and which when bound by VGAM897 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM897 host target proteins.

[12521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM897 gene, herein designated VGAM GENE, on one or more VGAM897 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12522] It is yet further appreciated that a function of VGAM897 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM897 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM897 correlate with, and may be deduced from, the identity of the host target genes which VGAM897 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12523] Nucleotide sequences of the VGAM897 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM897 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM897 are further de-

scribed hereinbelow with reference to Table 1.

[12524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM897 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12525] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 898 (VGAM898) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12526] VGAM898 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM898 was detected is described hereinabove with reference to Figs. 2-8.

[12527] VGAM898 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea mottle virus. VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12528] VGAM898 gene, herein designated VGAM GENE, encodes a VGAM898 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM898 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM898 precursor RNA is designated SEQ ID:884, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:884 is located at position 3264 relative to the genome of Cowpea mottle virus.

[12529] VGAM898 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12530] An enzyme complex designated DICER COMPLEX, dices the VGAM898 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM898 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM898 RNA is designated SEQ ID:3609, and is provided hereinbelow with reference to the sequence listing part.

[12531] VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12532] VGAM898 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM898 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM898 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12533] The complementary binding of VGAM898 RNA, herein designated VGAM RNA, to host target binding sites on VGAM898 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM898 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM898 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12534] It is appreciated that VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM898 host target genes. The mRNA of each one of this plurality of VGAM898 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM898 RNA, herein designated VGAM RNA, and which when bound by VGAM898 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM898 host target proteins.

[12535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM898 gene, herein designated VGAM GENE, on one or more VGAM898 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12536] It is yet further appreciated that a function of VGAM898 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM898 include diagnosis, prevention and treatment of viral infection by Cowpea mottle virus. Specific functions, and accordingly utilities, of VGAM898 correlate with, and may be deduced from, the identity of the host target genes which VGAM898 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12537] Nucleotide sequences of the VGAM898 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM898 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM898 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM898 are further described hereinbelow with reference to Table 1.

[12538] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM898 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12539] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 899 (VGAM899) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12540] VGAM899 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM899 was detected is described hereinabove with reference to Figs. 2-8.

[12541] VGAM899 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM899 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[12542] VGAM899 gene, herein designated VGAM GENE, encodes a VGAM899 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM899 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM899 precursor RNA is designated SEQ ID:885, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:885 is located at position 46153 relative to the genome of Human herpesvirus 2.

[12543] VGAM899 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12544] An enzyme complex designated DICER COMPLEX, dices

the VGAM899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM899 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM899 RNA is designated SEQ ID:3610, and is provided hereinbelow with reference to the sequence listing part.

[12545] VGAM899 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12546] VGAM899 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM899 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM899 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM899 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12547] The complementary binding of VGAM899 RNA, herein designated VGAM RNA, to host target binding sites on VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM899 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM899 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12548] It is appreciated that VGAM899 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM899 host target genes. The mRNA of each one of this plurality of VGAM899 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM899 RNA, herein designated VGAM RNA, and which when bound by VGAM899 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM899 host target proteins.

[12549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM899 gene, herein designated VGAM GENE, on one or more VGAM899 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12550] It is yet further appreciated that a function of VGAM899 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM899 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM899 correlate with, and may be deduced from, the identity of the host target genes which VGAM899 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12551] Nucleotide sequences of the VGAM899 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM899 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM899 are further described hereinbelow with reference to Table 1.

[12552] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM899 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12553] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 900 (VGAM900) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12554] VGAM900 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM900 was detected is described hereinabove with reference to Figs. 2-8.

[12555] VGAM900 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM900 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[12556] VGAM900 gene, herein designated VGAM GENE, encodes a VGAM900 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM900 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM900 precursor RNA is designated SEQ ID:886, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:886 is located at position 111776 relative to the genome of Human herpesvirus 5.

[12557] VGAM900 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12558] An enzyme complex designated DICER COMPLEX, dices the VGAM900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM900 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM900 RNA is designated SEQ ID:3611, and is provided hereinbelow with reference to the sequence listing part.

[12559] VGAM900 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12560] VGAM900 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM900 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM900 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12561] The complementary binding of VGAM900 RNA, herein designated VGAM RNA, to host target binding sites on VGAM900 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM900 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM900 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12562] It is appreciated that VGAM900 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM900 host target genes. The mRNA of each one of this plurality of VGAM900 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM900 RNA, herein designated VGAM RNA, and which when bound by VGAM900 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM900 host target proteins.

[12563] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM900 gene, herein designated VGAM GENE, on one or more VGAM900 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12564] It is yet further appreciated that a function of VGAM900 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM900 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM900 correlate with, and may be deduced from, the identity of the host target genes which VGAM900 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12565] Nucleotide sequences of the VGAM900 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM900 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM900 are further described hereinbelow with reference to Table 1.

[12566] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM900 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12567] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 901 (VGAM901) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12568] VGAM901 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM901 was detected is described hereinabove with reference to Figs. 2-8.

[12569] VGAM901 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-1.

VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12570] VGAM901 gene, herein designated VGAM GENE, encodes a VGAM901 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM901 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM901 precursor RNA is designated SEQ ID:887, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:887 is located at position 8223 relative to the genome of Sulfolobus virus SIRV-1.

[12571] VGAM901 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[12572] An enzyme complex designated DICER COMPLEX, dices the VGAM901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM901 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM901 RNA is designated SEQ ID:3612, and is provided hereinbelow with reference to the sequence listing part.

[12573] VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12574] VGAM901 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM901 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM901 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12575] The complementary binding of VGAM901 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM901 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM901 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12576] It is appreciated that VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM901 host target genes. The mRNA of each one of this plurality of VGAM901 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM901 RNA, herein designated VGAM RNA, and which when bound by VGAM901 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM901 host target proteins.

[12577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM901 gene, herein designated VGAM GENE, on one or more VGAM901 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12578] It is yet further appreciated that a function of VGAM901 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM901 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM901 correlate with, and may be deduced from, the identity of the host target genes which VGAM901 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12579] Nucleotide sequences of the VGAM901 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM901 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM901 are further described hereinbelow with reference to Table 1.

[12580] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM901 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12581] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 902 (VGAM902) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12582] VGAM902 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM902 was detected is described hereinabove with reference to Figs. 2-8.

[12583] VGAM902 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Sulfolobus virus SIRV-1. VGAM902 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12584] VGAM902 gene, herein designated VGAM GENE, encodes a VGAM902 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM902 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM902 precursor RNA is designated SEQ ID:888, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:888 is located at position 8730 relative to the genome of Sulfolobus virus SIRV-1.

[12585] VGAM902 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12586] An enzyme complex designated DICER COMPLEX, dices the VGAM902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM902 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM902 RNA is designated SEQ ID:3613, and is provided hereinbelow with reference to the sequence listing part.

[12587] VGAM902 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12588] VGAM902 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM902 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM902 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12589] The complementary binding of VGAM902 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM902 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM902 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12590] It is appreciated that VGAM902 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM902 host target genes. The mRNA of each one of this plurality of VGAM902 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM902 RNA, herein designated VGAM RNA, and which when bound by VGAM902 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM902 host target proteins.

[12591] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM902 gene, herein designated VGAM GENE, on one or more VGAM902 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12592] It is yet further appreciated that a function of VGAM902 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM902 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM902 correlate with, and may be deduced from, the identity of the host target genes which VGAM902 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12593] Nucleotide sequences of the VGAM902 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM902 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM902 are further described hereinbelow with reference to Table 1.

[12594] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM902 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12595] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 903 (VGAM903) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12596] VGAM903 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM903 was detected is described hereinabove with reference to Figs. 2-8.

[12597] VGAM903 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12598] VGAM903 gene, herein designated VGAM GENE, encodes a VGAM903 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM903 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM903 precursor RNA is designated SEQ ID:889, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:889 is located at position 178832 relative to the genome of Melanoplus sanguinipes entomopoxvirus.

[12599] VGAM903 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12600] An enzyme complex designated DICER COMPLEX, dices the VGAM903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM903 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM903 RNA is designated SEQ ID:3614, and is provided hereinbelow with reference to the sequence listing part.

[12601] VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12602] VGAM903 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM903 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM903 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[12603] The complementary binding of VGAM903 RNA, herein designated VGAM RNA, to host target binding sites on VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM903 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM903 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12604] It is appreciated that VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM903 host target genes. The mRNA of each one of this plurality of VGAM903 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM903 RNA, herein designated VGAM RNA, and which when bound by VGAM903 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM903 host target proteins.

[12605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM903 gene, herein designated VGAM GENE, on one or more VGAM903 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12606] It is yet further appreciated that a function of VGAM903 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM903 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM903 correlate with, and may be deduced from, the identity of the host target genes which VGAM903 binds and inhibits, and the function of these host target

genes, as elaborated hereinbelow.

[12607] Nucleotide sequences of the VGAM903 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM903 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM903 are further described hereinbelow with reference to Table 1.

[12608] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM903 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12609] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 904 (VGAM904) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12610] VGAM904 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM904 was detected is described hereinabove with reference to Figs. 2–8.

[12611] VGAM904 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12612] VGAM904 gene, herein designated VGAM GENE, encodes a VGAM904 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM904 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM904 precursor RNA is designated SEQ ID:890, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:890 is located at position 179537 relative to the genome of Melanoplus sanguinipes entomopoxvirus.

[12613] VGAM904 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12614] An enzyme complex designated DICER COMPLEX, dices the VGAM904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM904 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM904 RNA is designated SEQ ID:3615, and is provided hereinbelow with reference to the sequence listing part.

[12615] VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12616] VGAM904 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM904 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM904 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12617] The complementary binding of VGAM904 RNA, herein designated VGAM RNA, to host target binding sites on VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM904 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM904 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12618] It is appreciated that VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM904 host target genes. The mRNA of each one of this plurality of VGAM904 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM904 RNA, herein designated VGAM RNA, and which when bound by VGAM904 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM904 host target proteins.

[12619] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM904 gene, herein designated VGAM GENE, on one or more VGAM904 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12620] It is yet further appreciated that a function of VGAM904 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM904 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM904 correlate with, and may be deduced from,

the identity of the host target genes which VGAM904 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12621] Nucleotide sequences of the VGAM904 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM904 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM904 are further described hereinbelow with reference to Table 1.

[12622] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM904 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12623] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 905 (VGAM905) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12624] VGAM905 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM905 was detected is described hereinabove with reference to Figs. 2–8.

[12625] VGAM905 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12626] VGAM905 gene, herein designated VGAM GENE, encodes a VGAM905 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM905 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM905 precursor RNA is designated SEQ ID:891, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:891 is located at position 79238 relative to the genome of Saimiriine herpesvirus 2.

[12627] VGAM905 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM905 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12628] An enzyme complex designated DICER COMPLEX, dices the VGAM905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM905 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM905 RNA is designated SEQ ID:3616, and is provided hereinbelow with reference to the sequence listing part.

[12629] VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM905 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12630] VGAM905 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM905 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM905 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12631] The complementary binding of VGAM905 RNA, herein designated VGAM RNA, to host target binding sites on VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM905 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM905 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12632] It is appreciated that VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM905 host target genes. The mRNA of each one of this plurality of VGAM905 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM905 RNA, herein designated VGAM RNA, and which when bound by VGAM905 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM905 host target proteins.

[12633] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM905 gene, herein designated VGAM GENE, on one or more VGAM905 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12634] It is yet further appreciated that a function of VGAM905 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM905 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM905

correlate with, and may be deduced from, the identity of the host target genes which VGAM905 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12635] Nucleotide sequences of the VGAM905 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM905 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM905 are further described hereinbelow with reference to Table 1.

[12636] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM905 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12637] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 906 (VGAM906) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[12638] VGAM906 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM906 was detected is described hereinabove with reference to Figs. 2–8.

[12639] VGAM906 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12640] VGAM906 gene, herein designated VGAM GENE, encodes a VGAM906 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM906 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM906 precursor RNA is designated SEQ ID:892, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:892 is located at position 77662 relative to the genome of Saimiriine herpesvirus 2.

[12641] VGAM906 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM906 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12642] An enzyme complex designated DICER COMPLEX, dices the VGAM906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM906 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM906 RNA is designated SEQ ID:3617, and is provided hereinbelow with reference to the sequence listing part.

[12643] VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM906 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12644] VGAM906 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM906 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM906 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12645] The complementary binding of VGAM906 RNA, herein designated VGAM RNA, to host target binding sites on VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM906 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM906 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12646] It is appreciated that VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM906 host target genes. The mRNA of each one of this plurality of VGAM906 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM906 RNA, herein designated VGAM RNA, and which when bound by VGAM906 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM906 host target proteins.

[12647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM906 gene, herein designated VGAM GENE, on one or more VGAM906 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12648] It is yet further appreciated that a function of VGAM906 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM906 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2.

Specific functions, and accordingly utilities, of VGAM906 correlate with, and may be deduced from, the identity of the host target genes which VGAM906 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12649] Nucleotide sequences of the VGAM906 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM906 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM906 are further described hereinbelow with reference to Table 1.

[12650] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM906 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12651] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 907 (VGAM907) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[12652] VGAM907 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM907 was detected is described hereinabove with reference to Figs. 2–8.

[12653] VGAM907 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12654] VGAM907 gene, herein designated VGAM GENE, encodes a VGAM907 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM907 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM907 precursor RNA is designated SEQ ID:893, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:893 is located at position 79366 relative to the genome of Saimiriine herpesvirus 2.

[12655] VGAM907 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12656] An enzyme complex designated DICER COMPLEX, dices the VGAM907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM907 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM907 RNA is designated SEQ ID:3618, and is provided hereinbelow with reference to the sequence listing part.

[12657] VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12658] VGAM907 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM907 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM907 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM907 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12659] The complementary binding of VGAM907 RNA, herein designated VGAM RNA, to host target binding sites on VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM907 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM907 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12660] It is appreciated that VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM907 host target genes. The mRNA of each one of this plurality of VGAM907 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM907 RNA, herein designated VGAM RNA, and which when bound by VGAM907 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM907 host target proteins.

[12661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM907 gene, herein designated VGAM GENE, on one or more VGAM907 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12662] It is yet further appreciated that a function of VGAM907 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM907 include diagnosis, prevention and

treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM907 correlate with, and may be deduced from, the identity of the host target genes which VGAM907 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12663] Nucleotide sequences of the VGAM907 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM907 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM907 are further described hereinbelow with reference to Table 1.

[12664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM907 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12665] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 908 (VGAM908) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12666] VGAM908 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM908 was detected is described hereinabove with reference to Figs. 2–8.

[12667] VGAM908 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM908 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12668] VGAM908 gene, herein designated VGAM GENE, encodes a VGAM908 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM908 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM908 precursor RNA is designated SEQ ID:894, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:894 is located at position 78640 relative to the genome of Saimiriine herpesvirus 2.

[12669] VGAM908 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12670] An enzyme complex designated DICER COMPLEX, dices the VGAM908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM908 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM908 RNA is designated SEQ ID:3619, and is provided hereinbelow with reference to the sequence listing part.

[12671] VGAM908 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12672] VGAM908 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM908 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM908 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12673] The complementary binding of VGAM908 RNA, herein designated VGAM RNA, to host target binding sites on VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM908 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM908 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12674] It is appreciated that VGAM908 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM908 host target genes. The mRNA of each one of this plurality of VGAM908 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM908 RNA, herein designated VGAM

RNA, and which when bound by VGAM908 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM908 host target proteins.

[12675] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM908 gene, herein designated VGAM GENE, on one or more VGAM908 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12676] It is yet further appreciated that a function of VGAM908 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM908 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM908 correlate with, and may be deduced from, the identity of the host target genes which VGAM908 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12677] Nucleotide sequences of the VGAM908 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM908 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM908 are further described hereinbelow with reference to Table 1.

[12678] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM908 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12679] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 909 (VGAM909) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12680] VGAM909 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM909 was detected is described hereinabove with reference to Figs. 2–8.

[12681] VGAM909 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12682] VGAM909 gene, herein designated VGAM GENE, encodes a VGAM909 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM909 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM909 precursor RNA is designated SEQ ID:895, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:895 is located at position 60240 relative to

the genome of Alcelaphine herpesvirus 1.

[12683] VGAM909 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12684] An enzyme complex designated DICER COMPLEX, dices the VGAM909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM909 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM909 RNA is designated SEQ ID:3620, and is provided hereinbelow with reference to the sequence listing part.

[12685] VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12686] VGAM909 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM909 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM909 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12687] The complementary binding of VGAM909 RNA, herein designated VGAM RNA, to host target binding sites on VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM909 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM909 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12688] It is appreciated that VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM909 host target genes. The mRNA of each one of this plurality of VGAM909 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM909 RNA, herein designated VGAM RNA, and which when bound by VGAM909 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM909 host target proteins.

[12689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM909 gene, herein designated VGAM GENE, on one or more VGAM909 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12690] It is yet further appreciated that a function of VGAM909 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM909 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM909 correlate with, and may be deduced from, the identity of the host target genes which VGAM909 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12691] Nucleotide sequences of the VGAM909 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM909 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM909 are further described hereinbelow with reference to Table 1.

[12692] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM909 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12693] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 910 (VGAM910) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12694] VGAM910 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM910 was detected is described hereinabove with reference to Figs. 2–8.

[12695] VGAM910 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM910 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12696] VGAM910 gene, herein designated VGAM GENE, encodes a VGAM910 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM910 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM910 precursor RNA is designated SEQ ID:896, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:896 is located at position 61092 relative to the genome of Alcelaphine herpesvirus 1.

[12697] VGAM910 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12698] An enzyme complex designated DICER COMPLEX, dices the VGAM910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM910 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM910 RNA is designated SEQ ID:3621, and is provided hereinbelow with reference to the sequence

listing part.

[12699] VGAM910 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12700] VGAM910 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM910 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM910 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12701] The complementary binding of VGAM910 RNA, herein designated VGAM RNA, to host target binding sites on VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM910 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM910 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12702] It is appreciated that VGAM910 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM910 host target genes. The mRNA of each one of this plurality of VGAM910 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM910 RNA, herein designated VGAM RNA, and which when bound by VGAM910 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM910 host target proteins.

[12703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM910 gene, herein designated VGAM GENE, on one or more VGAM910 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12704] It is yet further appreciated that a function of VGAM910 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM910 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM910 correlate with, and may be deduced from, the identity of the host target genes which VGAM910 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12705] Nucleotide sequences of the VGAM910 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM910 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM910 are further described hereinbelow with reference to Table 1.

[12706] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM910 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12707] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 911 (VGAM911) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12708] VGAM911 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM911 was detected is described hereinabove with reference to Figs. 2–8.

[12709] VGAM911 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM911 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12710] VGAM911 gene, herein designated VGAM GENE, encodes a VGAM911 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM911 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM911 precursor RNA is designated SEQ ID:897, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:897 is located at position 56711 relative to the genome of Human herpesvirus 8.

[12711] VGAM911 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12712] An enzyme complex designated DICER COMPLEX, dices the VGAM911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM911 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM911 RNA is designated SEQ ID:3622, and

is provided hereinbelow with reference to the sequence listing part.

[12713] VGAM911 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12714] VGAM911 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM911 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM911 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12715] The complementary binding of VGAM911 RNA, herein designated VGAM RNA, to host target binding sites on VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM911 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM911 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12716] It is appreciated that VGAM911 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM911 host target genes. The mRNA of each one of this plurality of VGAM911 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM911 RNA, herein designated VGAM RNA, and which when bound by VGAM911 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM911 host target proteins.

[12717] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM911 gene, herein designated VGAM GENE, on one or more VGAM911 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12718] It is yet further appreciated that a function of VGAM911 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM911 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM911 correlate with, and may be deduced from, the identity of the host target genes which VGAM911 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12719] Nucleotide sequences of the VGAM911 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM911 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM911 are further described hereinbelow with reference to Table 1.

[12720] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM911 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12721] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 912 (VGAM912) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12722] VGAM912 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM912 was detected is described hereinabove with reference to Figs. 2–8.

[12723] VGAM912 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM912 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12724] VGAM912 gene, herein designated VGAM GENE, encodes a VGAM912 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM912 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM912 precursor RNA is

designated SEQ ID:898, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:898 is located at position 58652 relative to the genome of Human herpesvirus 8.

[12725] VGAM912 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12726] An enzyme complex designated DICER COMPLEX, dices the VGAM912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM912 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide se-

quence of VGAM912 RNA is designated SEQ ID:3623, and is provided hereinbelow with reference to the sequence listing part.

[12727] VGAM912 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12728] VGAM912 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM912 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM912 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12729] The complementary binding of VGAM912 RNA, herein designated VGAM RNA, to host target binding sites on VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM912 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM912 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12730] It is appreciated that VGAM912 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM912 host target genes. The mRNA of

each one of this plurality of VGAM912 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM912 RNA, herein designated VGAM RNA, and which when bound by VGAM912 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM912 host target proteins.

[12731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM912 gene, herein designated VGAM GENE, on one or more VGAM912 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[12732] It is yet further appreciated that a function of VGAM912 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM912 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM912 correlate with, and may be deduced from, the identity of the host target genes which VGAM912 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12733] Nucleotide sequences of the VGAM912 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM912 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM912 are further described hereinbelow with reference to Table 1.

[12734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM912 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[12735] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 913 (VGAM913) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12736] VGAM913 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM913 was detected is described hereinabove with reference to Figs. 2–8.

[12737] VGAM913 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos latent virus. VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12738] VGAM913 gene, herein designated VGAM GENE, encodes a VGAM913 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM913 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM913 precursor RNA is designated SEQ ID:899, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:899 is located at position 2180 relative to the genome of Pothos latent virus.

[12739] VGAM913 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12740] An enzyme complex designated DICER COMPLEX, dices the VGAM913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM913 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 74%) nucleotide sequence of VGAM913 RNA is designated SEQ ID:3624, and is provided hereinbelow with reference to the sequence listing part.

[12741] VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12742] VGAM913 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM913 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM913 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12743] The complementary binding of VGAM913 RNA, herein designated VGAM RNA, to host target binding sites on VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM913 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM913 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12744] It is appreciated that VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM913 host target genes. The mRNA of each one of this plurality of VGAM913 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM913 RNA, herein designated VGAM RNA, and which when bound by VGAM913 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM913 host target proteins.

[12745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM913 gene, herein designated VGAM GENE, on one or more VGAM913 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[12746] It is yet further appreciated that a function of VGAM913 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM913 include diagnosis, prevention and treatment of viral infection by Pothos latent virus. Specific functions, and accordingly utilities, of VGAM913 correlate with, and may be deduced from, the identity of the host target genes which VGAM913 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[12747] Nucleotide sequences of the VGAM913 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM913 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM913 are further described hereinbelow with reference to Table 1.

[12748] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM913 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12749] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 914 (VGAM914) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12750] VGAM914 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM914 was detected is described hereinabove with reference to Figs. 2–8.

[12751] VGAM914 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos latent virus. VGAM914 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12752] VGAM914 gene, herein designated VGAM GENE, encodes a VGAM914 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM914 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM914 precursor RNA is designated SEQ ID:900, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:900 is located at position 2846 relative to the genome of Pothos latent virus.

[12753] VGAM914 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12754] An enzyme complex designated DICER COMPLEX, dices the VGAM914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM914 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM914 RNA is designated SEQ ID:3625, and is provided hereinbelow with reference to the sequence listing part.

[12755] VGAM914 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12756] VGAM914 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM914 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM914 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12757] The complementary binding of VGAM914 RNA, herein designated VGAM RNA, to host target binding sites on VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM914 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM914 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12758] It is appreciated that VGAM914 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM914 host target genes. The mRNA of each one of this plurality of VGAM914 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM914 RNA, herein designated VGAM RNA, and which when bound by VGAM914 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM914 host target proteins.

[12759] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM914 gene, herein designated VGAM GENE, on one or more VGAM914 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12760] It is yet further appreciated that a function of VGAM914 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM914 include diagnosis, prevention and treatment of viral infection by Pothos latent virus. Specific functions, and accordingly utilities, of VGAM914 correlate with, and may be deduced from, the identity of the host target genes which VGAM914 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12761] Nucleotide sequences of the VGAM914 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM914 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM914 are further described hereinbelow with reference to Table 1.

[12762] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM914 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12763] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 915 (VGAM915) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12764] VGAM915 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM915 was detected is described hereinabove with reference to Figs. 2–8.

[12765] VGAM915 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichoplusia ni cytoplasmic polyhedrosis virus 15. VGAM915 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12766] VGAM915 gene, herein designated VGAM GENE, encodes a VGAM915 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM915 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM915 precursor RNA is designated SEQ ID:901, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:901 is located at position 1864 relative to the genome of Trichoplusia ni cytoplasmic polyhedrosis virus 15.

[12767] VGAM915 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12768] An enzyme complex designated DICER COMPLEX, dices the VGAM915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM915 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM915 RNA is designated SEQ ID:3626, and is provided hereinbelow with reference to the sequence listing part.

[12769] VGAM915 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12770] VGAM915 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM915 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM915 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12771] The complementary binding of VGAM915 RNA, herein designated VGAM RNA, to host target binding sites on VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM915 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM915 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[12772] It is appreciated that VGAM915 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM915 host target genes. The mRNA of each one of this plurality of VGAM915 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM915 RNA, herein designated VGAM RNA, and which when bound by VGAM915 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM915 host target proteins.

[12773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM915 gene, herein designated VGAM GENE, on one or more VGAM915 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12774] It is yet further appreciated that a function of VGAM915 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM915 include diagnosis, prevention and treatment of viral infection by Trichoplusia ni cytoplasmic polyhedrosis virus 15. Specific functions, and accordingly utilities, of VGAM915 correlate with, and may be deduced from, the identity of the host target genes which VGAM915 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12775] Nucleotide sequences of the VGAM915 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM915 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM915 are further described hereinbelow with reference to Table 1.

[12776] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM915 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12777] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 916 (VGAM916) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12778] VGAM916 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM916 was detected is described hereinabove with reference to Figs. 2-8.

[12779] VGAM916 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichoplusia ni cytoplasmic polyhedrosis virus 15. VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12780] VGAM916 gene, herein designated VGAM GENE, encodes a VGAM916 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM916 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM916 precursor RNA is designated SEQ ID:902, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:902 is located at position 762 relative to the genome of Trichoplusia ni cytoplasmic polyhedrosis virus 15.

[12781] VGAM916 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12782] An enzyme complex designated DICER COMPLEX, dices the VGAM916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM916 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM916 RNA is designated SEQ ID:3627, and is provided hereinbelow with reference to the sequence listing part.

[12783] VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12784] VGAM916 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM916 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM916 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12785] The complementary binding of VGAM916 RNA, herein designated VGAM RNA, to host target binding sites on VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM916 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM916 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12786] It is appreciated that VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM916 host target genes. The mRNA of each one of this plurality of VGAM916 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM916 RNA, herein designated VGAM RNA, and which when bound by VGAM916 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM916 host target proteins.

[12787] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM916 gene, herein designated VGAM GENE, on one or more VGAM916 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12788] It is yet further appreciated that a function of VGAM916 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM916 include diagnosis, prevention and treatment of viral infection by Trichoplusia ni cytoplasmic polyhedrosis virus 15. Specific functions, and accordingly utilities, of VGAM916 correlate with, and may be deduced from, the identity of the host target genes which VGAM916 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12789] Nucleotide sequences of the VGAM916 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM916 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM916 are further de-

scribed hereinbelow with reference to Table 1.

[12790] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM916 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12791] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 917 (VGAM917) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12792] VGAM917 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM917 was detected is described hereinabove with reference to Figs. 2-8.

[12793] VGAM917 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM917 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12794] VGAM917 gene, herein designated VGAM GENE, encodes a

VGAM917 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM917 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM917 precursor RNA is designated SEQ ID:903, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:903 is located at position 134932 relative to the genome of Vaccinia virus.

[12795] VGAM917 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12796] An enzyme complex designated DICER COMPLEX, dices the VGAM917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM917 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM917 RNA is designated SEQ ID:3628, and is provided hereinbelow with reference to the sequence listing part.

[12797] VGAM917 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12798] VGAM917 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM917 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM917 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12799] The complementary binding of VGAM917 RNA, herein designated VGAM RNA, to host target binding sites on VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM917 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM917 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12800] It is appreciated that VGAM917 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM917 host target genes. The mRNA of each one of this plurality of VGAM917 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM917 RNA, herein designated VGAM RNA, and which when bound by VGAM917 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM917 host target proteins.

[12801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM917 gene, herein designated VGAM GENE, on one or more VGAM917 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12802] It is yet further appreciated that a function of VGAM917 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM917 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM917 correlate with, and may be deduced from, the identity of the host target genes which VGAM917 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12803] Nucleotide sequences of the VGAM917 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM917 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM917 are further de-

scribed hereinbelow with reference to Table 1.

[12804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM917 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12805] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 918 (VGAM918) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12806] VGAM918 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM918 was detected is described hereinabove with reference to Figs. 2-8.

[12807] VGAM918 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12808] VGAM918 gene, herein designated VGAM GENE, encodes a

VGAM918 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM918 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM918 precursor RNA is designated SEQ ID:904, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:904 is located at position 642 relative to the genome of Vaccinia virus.

[12809] VGAM918 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12810] An enzyme complex designated DICER COMPLEX, dices the VGAM918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM918 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM918 RNA is designated SEQ ID:3629, and is provided hereinbelow with reference to the sequence listing part.

[12811] VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12812] VGAM918 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM918 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM918 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12813] The complementary binding of VGAM918 RNA, herein designated VGAM RNA, to host target binding sites on VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM918 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM918 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12814] It is appreciated that VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM918 host target genes. The mRNA of each one of this plurality of VGAM918 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM918 RNA, herein designated VGAM RNA, and which when bound by VGAM918 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM918 host target proteins.

[12815] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM918 gene, herein designated VGAM GENE, on one or more VGAM918 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12816] It is yet further appreciated that a function of VGAM918 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM918 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM918 correlate with, and may be deduced from, the identity of the host target genes which VGAM918 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12817] Nucleotide sequences of the VGAM918 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM918 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM918 are further de-

scribed hereinbelow with reference to Table 1.

[12818] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM918 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12819] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 919 (VGAM919) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12820] VGAM919 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM919 was detected is described hereinabove with reference to Figs. 2-8.

[12821] VGAM919 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12822] VGAM919 gene, herein designated VGAM GENE, encodes a

VGAM919 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM919 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM919 precursor RNA is designated SEQ ID:905, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:905 is located at position 963 relative to the genome of Vaccinia virus.

[12823] VGAM919 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12824] An enzyme complex designated DICER COMPLEX, dices the VGAM919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM919 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM919 RNA is designated SEQ ID:3630, and is provided hereinbelow with reference to the sequence listing part.

[12825] VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12826] VGAM919 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM919 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM919 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12827] The complementary binding of VGAM919 RNA, herein designated VGAM RNA, to host target binding sites on VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM919 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM919 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12828] It is appreciated that VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM919 host target genes. The mRNA of each one of this plurality of VGAM919 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM919 RNA, herein designated VGAM RNA, and which when bound by VGAM919 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM919 host target proteins.

[12829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM919 gene, herein designated VGAM GENE, on one or more VGAM919 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12830] It is yet further appreciated that a function of VGAM919 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM919 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM919 correlate with, and may be deduced from, the identity of the host target genes which VGAM919 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12831] Nucleotide sequences of the VGAM919 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM919 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM919 are further de-

scribed hereinbelow with reference to Table 1.

[12832] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM919 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12833] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 920 (VGAM920) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12834] VGAM920 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM920 was detected is described hereinabove with reference to Figs. 2-8.

[12835] VGAM920 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12836] VGAM920 gene, herein designated VGAM GENE, encodes a

VGAM920 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM920 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM920 precursor RNA is designated SEQ ID:906, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:906 is located at position 1243 relative to the genome of Vaccinia virus.

[12837] VGAM920 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12838] An enzyme complex designated DICER COMPLEX, dices the VGAM920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM920 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM920 RNA is designated SEQ ID:3631, and is provided hereinbelow with reference to the sequence listing part.

[12839] VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12840] VGAM920 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM920 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM920 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12841] The complementary binding of VGAM920 RNA, herein designated VGAM RNA, to host target binding sites on VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM920 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM920 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12842] It is appreciated that VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM920 host target genes. The mRNA of each one of this plurality of VGAM920 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM920 RNA, herein designated VGAM RNA, and which when bound by VGAM920 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM920 host target proteins.

[12843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM920 gene, herein designated VGAM GENE, on one or more VGAM920 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12844] It is yet further appreciated that a function of VGAM920 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM920 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM920 correlate with, and may be deduced from, the identity of the host target genes which VGAM920 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12845] Nucleotide sequences of the VGAM920 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM920 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM920 are further de-

scribed hereinbelow with reference to Table 1.

[12846] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM920 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12847] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 921 (VGAM921) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12848] VGAM921 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM921 was detected is described hereinabove with reference to Figs. 2-8.

[12849] VGAM921 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut clump virus. VGAM921 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12850] VGAM921 gene, herein designated VGAM GENE, encodes a VGAM921 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM921 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM921 precursor RNA is designated SEQ ID:907, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:907 is located at position 3787 relative to the genome of Peanut clump virus.

[12851] VGAM921 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12852] An enzyme complex designated DICER COMPLEX, dices the VGAM921 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM921 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM921 RNA is designated SEQ ID:3632, and is provided hereinbelow with reference to the sequence listing part.

[12853] VGAM921 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12854] VGAM921 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM921 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM921 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12855] The complementary binding of VGAM921 RNA, herein designated VGAM RNA, to host target binding sites on VGAM921 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM921 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM921 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12856] It is appreciated that VGAM921 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM921 host target genes. The mRNA of each one of this plurality of VGAM921 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM921 RNA, herein designated VGAM RNA, and which when bound by VGAM921 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM921 host target proteins.

[12857] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM921 gene, herein designated VGAM GENE, on one or more VGAM921 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12858] It is yet further appreciated that a function of VGAM921 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM921 include diagnosis, prevention and treatment of viral infection by Peanut clump virus. Specific functions, and accordingly utilities, of VGAM921 correlate with, and may be deduced from, the identity of the host target genes which VGAM921 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12859] Nucleotide sequences of the VGAM921 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM921 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM921 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM921 are further described hereinbelow with reference to Table 1.

[12860] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM921 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12861] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 922 (VGAM922) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12862] VGAM922 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM922 was detected is described hereinabove with reference to Figs. 2-8.

[12863] VGAM922 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut clump virus. VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[12864] VGAM922 gene, herein designated VGAM GENE, encodes a VGAM922 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM922 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM922 precursor RNA is designated SEQ ID:908, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:908 is located at position 1130 relative to the genome of Peanut clump virus.

[12865] VGAM922 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12866] An enzyme complex designated DICER COMPLEX, dices

the VGAM922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM922 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM922 RNA is designated SEQ ID:3633, and is provided hereinbelow with reference to the sequence listing part.

[12867] VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12868] VGAM922 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM922 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM922 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM922 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12869] The complementary binding of VGAM922 RNA, herein designated VGAM RNA, to host target binding sites on VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM922 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM922 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12870] It is appreciated that VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM922 host target genes. The mRNA of each one of this plurality of VGAM922 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM922 RNA, herein designated VGAM RNA, and which when bound by VGAM922 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM922 host target proteins.

[12871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM922 gene, herein designated VGAM GENE, on one or more VGAM922 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12872] It is yet further appreciated that a function of VGAM922 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM922 include diagnosis, prevention and treatment of viral infection by Peanut clump virus. Specific functions, and accordingly utilities, of VGAM922 correlate with, and may be deduced from, the identity of the host target genes which VGAM922 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12873] Nucleotide sequences of the VGAM922 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM922 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM922 are further described hereinbelow with reference to Table 1.

[12874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM922 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12875] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 923 (VGAM923) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12876] VGAM923 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM923 was detected is described hereinabove with reference to Figs. 2-8.

[12877] VGAM923 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut clump virus. VGAM923 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[12878] VGAM923 gene, herein designated VGAM GENE, encodes a VGAM923 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM923 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM923 precursor RNA is designated SEQ ID:909, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:909 is located at position 1684 relative to the genome of Peanut clump virus.

[12879] VGAM923 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12880] An enzyme complex designated DICER COMPLEX, dices the VGAM923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM923 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM923 RNA is designated SEQ ID:3634, and is provided hereinbelow with reference to the sequence listing part.

[12881] VGAM923 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12882] VGAM923 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM923 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM923 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12883] The complementary binding of VGAM923 RNA, herein designated VGAM RNA, to host target binding sites on VGAM923 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM923 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM923 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12884] It is appreciated that VGAM923 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM923 host target genes. The mRNA of each one of this plurality of VGAM923 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM923 RNA, herein designated VGAM RNA, and which when bound by VGAM923 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM923 host target proteins.

[12885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM923 gene, herein designated VGAM GENE, on one or more VGAM923 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12886] It is yet further appreciated that a function of VGAM923 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM923 include diagnosis, prevention and treatment of viral infection by Peanut clump virus. Specific functions, and accordingly utilities, of VGAM923 correlate with, and may be deduced from, the identity of the host target genes which VGAM923 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12887] Nucleotide sequences of the VGAM923 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM923 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM923 are further described hereinbelow with reference to Table 1.

[12888] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM923 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12889] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 924 (VGAM924) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12890] VGAM924 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM924 was detected is described hereinabove with reference to Figs. 2-8.

[12891] VGAM924 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and

kidney necrosis virus. VGAM924 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12892] VGAM924 gene, herein designated VGAM GENE, encodes a VGAM924 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM924 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM924 precursor RNA is designated SEQ ID:910, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:910 is located at position 67724 relative to the genome of infectious spleen and kidney necrosis virus.

[12893] VGAM924 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12894] An enzyme complex designated DICER COMPLEX, dices the VGAM924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM924 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM924 RNA is designated SEQ ID:3635, and is provided hereinbelow with reference to the sequence listing part.

[12895] VGAM924 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12896] VGAM924 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM924 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM924 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12897] The complementary binding of VGAM924 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM924 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM924 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12898] It is appreciated that VGAM924 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM924 host target genes. The mRNA of each one of this plurality of VGAM924 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM924 RNA, herein designated VGAM RNA, and which when bound by VGAM924 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM924 host target proteins.

[12899] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM924 gene, herein designated VGAM GENE, on one or more VGAM924 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12900] It is yet further appreciated that a function of VGAM924 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM924 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM924 correlate with, and may be deduced from, the identity of the host target genes which VGAM924 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12901] Nucleotide sequences of the VGAM924 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM924 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM924 are further described hereinbelow with reference to Table 1.

[12902] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM924 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12903] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 925 (VGAM925) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12904] VGAM925 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM925 was detected is described hereinabove with reference to Figs. 2-8.

[12905] VGAM925 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12906] VGAM925 gene, herein designated VGAM GENE, encodes a VGAM925 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM925 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM925 precursor RNA is designated SEQ ID:911, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:911 is located at position 67920 relative to the genome of infectious spleen and kidney necrosis virus.

[12907] VGAM925 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12908] An enzyme complex designated DICER COMPLEX, dices the VGAM925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM925 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM925 RNA is designated SEQ ID:3636, and is provided hereinbelow with reference to the sequence listing part.

[12909] VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12910] VGAM925 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM925 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM925 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[12911] The complementary binding of VGAM925 RNA, herein designated VGAM RNA, to host target binding sites on VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM925 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM925 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12912] It is appreciated that VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM925 host target genes. The mRNA of each one of this plurality of VGAM925 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM925 RNA, herein designated VGAM RNA, and which when bound by VGAM925 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM925 host target proteins.

[12913] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM925 gene, herein designated VGAM GENE, on one or more VGAM925 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12914] It is yet further appreciated that a function of VGAM925 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM925 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM925 correlate with, and may be deduced from, the identity of the host target genes which VGAM925 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[12915] Nucleotide sequences of the VGAM925 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM925 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM925 are further described hereinbelow with reference to Table 1.

[12916] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM925 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12917] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 926 (VGAM926) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12918] VGAM926 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM926 was detected is described hereinabove with reference to Figs. 2–8.

[12919] VGAM926 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12920] VGAM926 gene, herein designated VGAM GENE, encodes a VGAM926 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM926 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM926 precursor RNA is designated SEQ ID:912, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:912 is located at position 67259 relative to the genome of infectious spleen and kidney necrosis virus.

[12921] VGAM926 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12922] An enzyme complex designated DICER COMPLEX, dices the VGAM926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM926 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM926 RNA is designated SEQ ID:3637, and is provided hereinbelow with reference to the sequence listing part.

[12923] VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12924] VGAM926 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM926 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM926 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12925] The complementary binding of VGAM926 RNA, herein designated VGAM RNA, to host target binding sites on VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM926 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM926 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12926] It is appreciated that VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM926 host target genes. The mRNA of each one of this plurality of VGAM926 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM926 RNA, herein designated VGAM RNA, and which when bound by VGAM926 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM926 host target proteins.

[12927] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM926 gene, herein designated VGAM GENE, on one or more VGAM926 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12928] It is yet further appreciated that a function of VGAM926 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM926 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM926 correlate with, and may be deduced

from, the identity of the host target genes which VGAM926 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12929] Nucleotide sequences of the VGAM926 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM926 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM926 are further described hereinbelow with reference to Table 1.

[12930] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM926 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12931] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 927 (VGAM927) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12932] VGAM927 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM927 was detected is described hereinabove with reference to Figs. 2–8.

[12933] VGAM927 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12934] VGAM927 gene, herein designated VGAM GENE, encodes a VGAM927 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM927 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM927 precursor RNA is designated SEQ ID:913, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:913 is located at position 65593 relative to the genome of infectious spleen and kidney necrosis virus.

[12935] VGAM927 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM927 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12936] An enzyme complex designated DICER COMPLEX, dices the VGAM927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM927 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM927 RNA is designated SEQ ID:3638, and is provided hereinbelow with reference to the sequence listing part.

[12937] VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM927 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12938] VGAM927 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM927 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM927 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12939] The complementary binding of VGAM927 RNA, herein designated VGAM RNA, to host target binding sites on VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM927 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM927 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12940] It is appreciated that VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM927 host target genes. The mRNA of each one of this plurality of VGAM927 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM927 RNA, herein designated VGAM RNA, and which when bound by VGAM927 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM927 host target proteins.

[12941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM927 gene, herein designated VGAM GENE, on one or more VGAM927 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12942] It is yet further appreciated that a function of VGAM927 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM927 include diagnosis, prevention and treatment of viral infection by infectious spleen and kid-

ney necrosis virus. Specific functions, and accordingly utilities, of VGAM927 correlate with, and may be deduced from, the identity of the host target genes which VGAM927 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12943] Nucleotide sequences of the VGAM927 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM927 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM927 are further described hereinbelow with reference to Table 1.

[12944] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM927 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12945] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 928 (VGAM928) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[12946] VGAM928 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM928 was detected is described hereinabove with reference to Figs. 2–8.

[12947] VGAM928 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM928 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12948] VGAM928 gene, herein designated VGAM GENE, encodes a VGAM928 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM928 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM928 precursor RNA is designated SEQ ID:914, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:914 is located at position 67062 relative to the genome of infectious spleen and kidney necrosis virus.

[12949] VGAM928 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12950] An enzyme complex designated DICER COMPLEX, dices the VGAM928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM928 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM928 RNA is designated SEQ ID:3639, and is provided hereinbelow with reference to the sequence listing part.

[12951] VGAM928 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12952] VGAM928 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM928 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM928 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12953] The complementary binding of VGAM928 RNA, herein designated VGAM RNA, to host target binding sites on VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM928 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM928 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12954] It is appreciated that VGAM928 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM928 host target genes. The mRNA of each one of this plurality of VGAM928 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM928 RNA, herein designated VGAM

RNA, and which when bound by VGAM928 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM928 host target proteins.

[12955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM928 gene, herein designated VGAM GENE, on one or more VGAM928 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12956] It is yet further appreciated that a function of VGAM928 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM928 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM928 correlate with, and may be deduced from, the identity of the host target genes which VGAM928 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12957] Nucleotide sequences of the VGAM928 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM928 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM928 are further described hereinbelow with reference to Table 1.

[12958] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM928 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12959] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 929 (VGAM929) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12960] VGAM929 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM929 was detected is described hereinabove with reference to Figs. 2–8.

[12961] VGAM929 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM929 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12962] VGAM929 gene, herein designated VGAM GENE, encodes a VGAM929 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM929 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM929 precursor RNA is designated SEQ ID:915, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:915 is located at position 64221 relative to

the genome of infectious spleen and kidney necrosis virus.

[12963] VGAM929 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12964] An enzyme complex designated DICER COMPLEX, dices the VGAM929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM929 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM929 RNA is designated SEQ ID:3640, and is provided hereinbelow with reference to the sequence

listing part.

[12965] VGAM929 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12966] VGAM929 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM929 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM929 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12967] The complementary binding of VGAM929 RNA, herein designated VGAM RNA, to host target binding sites on VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM929 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM929 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12968] It is appreciated that VGAM929 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM929 host target genes. The mRNA of each one of this plurality of VGAM929 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM929 RNA, herein designated VGAM RNA, and which when bound by VGAM929 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM929 host target proteins.

[12969] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM929 gene, herein designated VGAM GENE, on one or more VGAM929 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12970] It is yet further appreciated that a function of VGAM929 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM929 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM929 correlate with, and may be deduced from, the identity of the host target genes which VGAM929 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12971] Nucleotide sequences of the VGAM929 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM929 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM929 are further described hereinbelow with reference to Table 1.

[12972] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM929 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12973] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 930 (VGAM930) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12974] VGAM930 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM930 was detected is described hereinabove with reference to Figs. 2–8.

[12975] VGAM930 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12976] VGAM930 gene, herein designated VGAM GENE, encodes a VGAM930 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM930 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM930 precursor RNA is designated SEQ ID:916, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:916 is located at position 48640 relative to the genome of Amsacta moorei entomopoxvirus.

[12977] VGAM930 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12978] An enzyme complex designated DICER COMPLEX, dices the VGAM930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM930 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM930 RNA is designated SEQ ID:3641, and

is provided hereinbelow with reference to the sequence listing part.

[12979] VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12980] VGAM930 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM930 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM930 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12981] The complementary binding of VGAM930 RNA, herein designated VGAM RNA, to host target binding sites on VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM930 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM930 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12982] It is appreciated that VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM930 host target genes. The mRNA of each one of this plurality of VGAM930 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM930 RNA, herein designated VGAM RNA, and which when bound by VGAM930 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM930 host target proteins.

[12983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM930 gene, herein designated VGAM GENE, on one or more VGAM930 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12984] It is yet further appreciated that a function of VGAM930 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM930 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM930 correlate with, and may be deduced from, the identity of the host target genes which VGAM930 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12985] Nucleotide sequences of the VGAM930 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM930 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM930 are further described hereinbelow with reference to Table 1.

[12986] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM930 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[12987] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 931 (VGAM931) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[12988] VGAM931 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM931 was detected is described hereinabove with reference to Figs. 2–8.

[12989] VGAM931 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM931 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[12990] VGAM931 gene, herein designated VGAM GENE, encodes a VGAM931 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM931 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM931 precursor RNA is

designated SEQ ID:917, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:917 is located at position 133625 relative to the genome of African swine fever virus.

[12991] VGAM931 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12992] An enzyme complex designated DICER COMPLEX, dices the VGAM931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM931 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide se-

quence of VGAM931 RNA is designated SEQ ID:3642, and is provided hereinbelow with reference to the sequence listing part.

[12993] VGAM931 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12994] VGAM931 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM931 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM931 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12995] The complementary binding of VGAM931 RNA, herein designated VGAM RNA, to host target binding sites on VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM931 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM931 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[12996] It is appreciated that VGAM931 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM931 host target genes. The mRNA of

each one of this plurality of VGAM931 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM931 RNA, herein designated VGAM RNA, and which when bound by VGAM931 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM931 host target proteins.

[12997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM931 gene, herein designated VGAM GENE, on one or more VGAM931 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[12998] It is yet further appreciated that a function of VGAM931 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM931 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM931 correlate with, and may be deduced from, the identity of the host target genes which VGAM931 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[12999] Nucleotide sequences of the VGAM931 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM931 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM931 are further described hereinbelow with reference to Table 1.

[13000] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM931 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[13001] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 932 (VGAM932) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13002] VGAM932 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM932 was detected is described hereinabove with reference to Figs. 2–8.

[13003] VGAM932 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13004] VGAM932 gene, herein designated VGAM GENE, encodes a VGAM932 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM932 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM932 precursor RNA is designated SEQ ID:918, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:918 is located at position 122063 relative to the genome of Human herpesvirus 4.

[13005] VGAM932 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13006] An enzyme complex designated DICER COMPLEX, dices the VGAM932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM932 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 73%) nucleotide sequence of VGAM932 RNA is designated SEQ ID:3643, and is provided hereinbelow with reference to the sequence listing part.

[13007] VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13008] VGAM932 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM932 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM932 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13009] The complementary binding of VGAM932 RNA, herein designated VGAM RNA, to host target binding sites on VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM932 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM932 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13010] It is appreciated that VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM932 host target genes. The mRNA of each one of this plurality of VGAM932 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM932 RNA, herein designated VGAM RNA, and which when bound by VGAM932 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM932 host target proteins.

[13011] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM932 gene, herein designated VGAM GENE, on one or more VGAM932 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [13012] It is yet further appreciated that a function of VGAM932 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM932 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM932 correlate with, and may be deduced from, the identity of the host target genes which VGAM932 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [13013] Nucleotide sequences of the VGAM932 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM932 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM932 are further described hereinbelow with reference to Table 1.
- [13014] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM932 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13015] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 933 (VGAM933) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13016] VGAM933 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM933 was detected is described hereinabove with reference to Figs. 2–8.

[13017] VGAM933 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM933 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13018] VGAM933 gene, herein designated VGAM GENE, encodes a VGAM933 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM933 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM933 precursor RNA is designated SEQ ID:919, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:919 is located at position 123567 relative to the genome of Human herpesvirus 4.

[13019] VGAM933 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13020] An enzyme complex designated DICER COMPLEX, dices the VGAM933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM933 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM933 RNA is designated SEQ ID:3644, and is provided hereinbelow with reference to the sequence listing part.

[13021] VGAM933 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13022] VGAM933 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM933 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM933 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13023] The complementary binding of VGAM933 RNA, herein designated VGAM RNA, to host target binding sites on VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM933 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM933 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13024] It is appreciated that VGAM933 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM933 host target genes. The mRNA of each one of this plurality of VGAM933 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM933 RNA, herein designated VGAM RNA, and which when bound by VGAM933 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM933 host target proteins.

[13025] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM933 gene, herein designated VGAM GENE, on one or more VGAM933 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13026] It is yet further appreciated that a function of VGAM933 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM933 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM933 correlate with, and may be deduced from, the identity of the host target genes which VGAM933 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13027] Nucleotide sequences of the VGAM933 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM933 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM933 are further described hereinbelow with reference to Table 1.

[13028] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM933 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13029] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 934 (VGAM934) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13030] VGAM934 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM934 was detected is described hereinabove with reference to Figs. 2–8.

[13031] VGAM934 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13032] VGAM934 gene, herein designated VGAM GENE, encodes a VGAM934 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM934 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM934 precursor RNA is designated SEQ ID:920, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:920 is located at position 123384 relative to the genome of Human herpesvirus 4.

[13033] VGAM934 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13034] An enzyme complex designated DICER COMPLEX, dices the VGAM934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM934 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM934 RNA is designated SEQ ID:3645, and is provided hereinbelow with reference to the sequence listing part.

[13035] VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13036] VGAM934 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM934 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM934 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13037] The complementary binding of VGAM934 RNA, herein designated VGAM RNA, to host target binding sites on VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM934 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM934 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13038] It is appreciated that VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM934 host target genes. The mRNA of each one of this plurality of VGAM934 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM934 RNA, herein designated VGAM RNA, and which when bound by VGAM934 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM934 host target proteins.

[13039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM934 gene, herein designated VGAM GENE, on one or more VGAM934 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13040] It is yet further appreciated that a function of VGAM934 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM934 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM934 correlate with, and may be deduced from, the identity of the host target genes which VGAM934 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13041] Nucleotide sequences of the VGAM934 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM934 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM934 are further described hereinbelow with reference to Table 1.

[13042] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM934 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13043] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 935 (VGAM935) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13044] VGAM935 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM935 was detected is described hereinabove with reference to Figs. 2–8.

[13045] VGAM935 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13046] VGAM935 gene, herein designated VGAM GENE, encodes a VGAM935 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM935 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM935 precursor RNA is designated SEQ ID:921, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:921 is located at position 137342 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[13047] VGAM935 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13048] An enzyme complex designated DICER COMPLEX, dices the VGAM935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM935 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM935 RNA is designated SEQ ID:3646, and is provided hereinbelow with reference to the sequence listing part.

[13049] VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13050] VGAM935 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM935 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM935 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13051] The complementary binding of VGAM935 RNA, herein designated VGAM RNA, to host target binding sites on VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM935 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM935 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13052] It is appreciated that VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM935 host target genes. The mRNA of each one of this plurality of VGAM935 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM935 RNA, herein designated VGAM RNA, and which when bound by VGAM935 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM935 host target proteins.

[13053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM935 gene, herein designated VGAM GENE, on one or more VGAM935 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13054] It is yet further appreciated that a function of VGAM935 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM935 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM935 correlate with, and may be deduced from, the identity of the host target genes which VGAM935 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13055] Nucleotide sequences of the VGAM935 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM935 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM935 are further described hereinbelow with reference to Table 1.

[13056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM935 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13057] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 936 (VGAM936) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13058] VGAM936 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM936 was detected is described hereinabove with reference to Figs. 2-8.

[13059] VGAM936 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13060] VGAM936 gene, herein designated VGAM GENE, encodes a

VGAM936 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM936 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM936 precursor RNA is designated SEQ ID:922, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:922 is located at position 139973 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[13061] VGAM936 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13062] An enzyme complex designated DICER COMPLEX, dices the VGAM936 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM936 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM936 RNA is designated SEQ ID:3647, and is provided hereinbelow with reference to the sequence listing part.

[13063] VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13064] VGAM936 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM936 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM936 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13065] The complementary binding of VGAM936 RNA, herein designated VGAM RNA, to host target binding sites on VGAM936 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM936 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM936 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13066] It is appreciated that VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM936 host target genes. The mRNA of each one of this plurality of VGAM936 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM936 RNA, herein designated VGAM RNA, and which when bound by VGAM936 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM936 host target proteins.

[13067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM936 gene, herein designated VGAM GENE, on one or more VGAM936 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13068] It is yet further appreciated that a function of VGAM936 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM936 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM936 correlate with, and may be deduced from, the identity of the host target genes which VGAM936 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13069] Nucleotide sequences of the VGAM936 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM936 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM936 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM936 are further described hereinbelow with reference to Table 1.

[13070] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM936 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13071] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 937 (VGAM937) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13072] VGAM937 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM937 was detected is described hereinabove with reference to Figs. 2-8.

[13073] VGAM937 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[13074] VGAM937 gene, herein designated VGAM GENE, encodes a VGAM937 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM937 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM937 precursor RNA is designated SEQ ID:923, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:923 is located at position 139184 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[13075] VGAM937 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13076] An enzyme complex designated DICER COMPLEX, dices the VGAM937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM937 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM937 RNA is designated SEQ ID:3648, and is provided hereinbelow with reference to the sequence listing part.

[13077] VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13078] VGAM937 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM937 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM937 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13079] The complementary binding of VGAM937 RNA, herein designated VGAM RNA, to host target binding sites on VGAM937 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM937 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM937 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13080] It is appreciated that VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM937 host target genes. The mRNA of each one of this plurality of VGAM937 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM937 RNA, herein designated VGAM RNA, and which when bound by VGAM937 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM937 host target proteins.

[13081] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM937 gene, herein designated VGAM GENE, on one or more VGAM937 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13082] It is yet further appreciated that a function of VGAM937 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM937 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM937 correlate with, and may be deduced from, the identity of the host target genes which VGAM937 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13083] Nucleotide sequences of the VGAM937 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM937 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM937 are further described hereinbelow with reference to Table 1.

[13084] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM937 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13085] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 938 (VGAM938) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13086] VGAM938 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM938 was detected is described hereinabove with reference to Figs. 2-8.

[13087] VGAM938 gene, herein designated VGAM GENE, is a viral gene contained in the genome of beet soil-borne mosaic

virus. VGAM938 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13088] VGAM938 gene, herein designated VGAM GENE, encodes a VGAM938 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM938 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM938 precursor RNA is designated SEQ ID:924, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:924 is located at position 709 relative to the genome of beet soil-borne mosaic virus.

[13089] VGAM938 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[13090] An enzyme complex designated DICER COMPLEX, dices the VGAM938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM938 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM938 RNA is designated SEQ ID:3649, and is provided hereinbelow with reference to the sequence listing part.

[13091] VGAM938 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13092] VGAM938 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM938 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM938 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13093] The complementary binding of VGAM938 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM938 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM938 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13094] It is appreciated that VGAM938 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM938 host target genes. The mRNA of each one of this plurality of VGAM938 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM938 RNA, herein designated VGAM RNA, and which when bound by VGAM938 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM938 host target proteins.

[13095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM938 gene, herein designated VGAM GENE, on one or more VGAM938 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13096] It is yet further appreciated that a function of VGAM938 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM938 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM938 correlate with, and may be deduced from, the identity of the host target genes which VGAM938 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13097] Nucleotide sequences of the VGAM938 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM938 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM938 are further described hereinbelow with reference to Table 1.

[13098] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM938 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13099] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 939 (VGAM939) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13100] VGAM939 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM939 was detected is described hereinabove with reference to Figs. 2-8.

[13101] VGAM939 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of beet soil-borne mosaic virus. VGAM939 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13102] VGAM939 gene, herein designated VGAM GENE, encodes a VGAM939 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM939 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM939 precursor RNA is designated SEQ ID:925, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:925 is located at position 1784 relative to the genome of beet soil-borne mosaic virus.

[13103] VGAM939 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13104] An enzyme complex designated DICER COMPLEX, dices the VGAM939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM939 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM939 RNA is designated SEQ ID:3650, and is provided hereinbelow with reference to the sequence listing part.

[13105] VGAM939 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13106] VGAM939 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM939 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM939 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13107] The complementary binding of VGAM939 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM939 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM939 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13108] It is appreciated that VGAM939 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM939 host target genes. The mRNA of each one of this plurality of VGAM939 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM939 RNA, herein designated VGAM RNA, and which when bound by VGAM939 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM939 host target proteins.

[13109] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM939 gene, herein designated VGAM GENE, on one or more VGAM939 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13110] It is yet further appreciated that a function of VGAM939 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM939 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM939 correlate with, and may be deduced from, the identity of the host target genes which VGAM939 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13111] Nucleotide sequences of the VGAM939 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM939 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM939 are further described hereinbelow with reference to Table 1.

[13112] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM939 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13113] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 940 (VGAM940) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13114] VGAM940 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM940 was detected is described hereinabove with reference to Figs. 2-8.

[13115] VGAM940 gene, herein designated VGAM GENE, is a viral gene contained in the genome of beet soil-borne mosaic virus. VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13116] VGAM940 gene, herein designated VGAM GENE, encodes a VGAM940 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM940 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM940 precursor RNA is designated SEQ ID:926, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:926 is located at position 2221 relative to the genome of beet soil-borne mosaic virus.

[13117] VGAM940 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13118] An enzyme complex designated DICER COMPLEX, dices the VGAM940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM940 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM940 RNA is designated SEQ ID:3651, and is provided hereinbelow with reference to the sequence listing part.

[13119] VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[13120] VGAM940 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM940 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM940 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13121] The complementary binding of VGAM940 RNA, herein designated VGAM RNA, to host target binding sites on VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM940 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM940 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13122] It is appreciated that VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM940 host target genes. The mRNA of each one of this plurality of VGAM940 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM940 RNA, herein designated VGAM RNA, and which when bound by VGAM940 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM940 host target proteins.

[13123] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM940 gene, herein designated VGAM GENE, on one or

more VGAM940 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13124] It is yet further appreciated that a function of VGAM940 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM940 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM940 correlate with, and may be deduced from, the identity of the host target genes which VGAM940 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13125] Nucleotide sequences of the VGAM940 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM940 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM940 are further described hereinbelow with reference to Table 1.

[13126] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM940 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13127] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 941 (VGAM941) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13128] VGAM941 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM941 was detected is described

hereinabove with reference to Figs. 2–8.

[13129] VGAM941 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM941 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13130] VGAM941 gene, herein designated VGAM GENE, encodes a VGAM941 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM941 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM941 precursor RNA is designated SEQ ID:927, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:927 is located at position 5149 relative to the genome of infectious spleen and kidney necrosis virus.

[13131] VGAM941 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13132] An enzyme complex designated DICER COMPLEX, dices the VGAM941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM941 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM941 RNA is designated SEQ ID:3652, and is provided hereinbelow with reference to the sequence listing part.

[13133] VGAM941 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13134] VGAM941 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM941 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM941 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13135] The complementary binding of VGAM941 RNA, herein designated VGAM RNA, to host target binding sites on VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM941 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM941 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13136] It is appreciated that VGAM941 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM941 host target genes. The mRNA of each one of this plurality of VGAM941 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM941 RNA, herein designated VGAM RNA, and which when bound by VGAM941 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM941 host target proteins.

[13137] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM941 gene, herein designated VGAM GENE, on one or more VGAM941 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13138] It is yet further appreciated that a function of VGAM941 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM941 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM941 correlate with, and may be deduced from, the identity of the host target genes which

VGAM941 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13139] Nucleotide sequences of the VGAM941 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM941 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM941 are further described hereinbelow with reference to Table 1.

[13140] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM941 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13141] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 942 (VGAM942) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13142] VGAM942 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM942 was detected is described hereinabove with reference to Figs. 2–8.

[13143] VGAM942 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13144] VGAM942 gene, herein designated VGAM GENE, encodes a VGAM942 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM942 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM942 precursor RNA is designated SEQ ID:928, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:928 is located at position 3787 relative to the genome of infectious spleen and kidney necrosis virus.

[13145] VGAM942 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM942 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13146] An enzyme complex designated DICER COMPLEX, dices the VGAM942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM942 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM942 RNA is designated SEQ ID:3653, and is provided hereinbelow with reference to the sequence listing part.

[13147] VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM942 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13148] VGAM942 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM942 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM942 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13149] The complementary binding of VGAM942 RNA, herein designated VGAM RNA, to host target binding sites on VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM942 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM942 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13150] It is appreciated that VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM942 host target genes. The mRNA of each one of this plurality of VGAM942 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM942 RNA, herein designated VGAM RNA, and which when bound by VGAM942 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM942 host target proteins.

[13151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM942 gene, herein designated VGAM GENE, on one or more VGAM942 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13152] It is yet further appreciated that a function of VGAM942 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM942 include diagnosis, prevention and treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly

utilities, of VGAM942 correlate with, and may be deduced from, the identity of the host target genes which VGAM942 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13153] Nucleotide sequences of the VGAM942 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM942 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM942 are further described hereinbelow with reference to Table 1.

[13154] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM942 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13155] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 943 (VGAM943) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[13156] VGAM943 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM943 was detected is described hereinabove with reference to Figs. 2–8.

[13157] VGAM943 gene, herein designated VGAM GENE, is a viral gene contained in the genome of infectious spleen and kidney necrosis virus. VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13158] VGAM943 gene, herein designated VGAM GENE, encodes a VGAM943 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM943 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM943 precursor RNA is designated SEQ ID:929, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:929 is located at position 6007 relative to the genome of infectious spleen and kidney necrosis virus.

[13159] VGAM943 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13160] An enzyme complex designated DICER COMPLEX, dices the VGAM943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM943 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM943 RNA is designated SEQ ID:3654, and is provided hereinbelow with reference to the sequence listing part.

[13161] VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13162] VGAM943 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM943 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM943 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM943 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13163] The complementary binding of VGAM943 RNA, herein designated VGAM RNA, to host target binding sites on VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM943 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM943 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13164] It is appreciated that VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM943 host target genes. The mRNA of each one of this plurality of VGAM943 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM943 RNA, herein designated VGAM RNA, and which when bound by VGAM943 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM943 host target proteins.

[13165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM943 gene, herein designated VGAM GENE, on one or more VGAM943 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13166] It is yet further appreciated that a function of VGAM943 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM943 include diagnosis, prevention and

treatment of viral infection by infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM943 correlate with, and may be deduced from, the identity of the host target genes which VGAM943 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13167] Nucleotide sequences of the VGAM943 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM943 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM943 are further described hereinbelow with reference to Table 1.

[13168] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM943 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13169] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 944 (VGAM944) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13170] VGAM944 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM944 was detected is described hereinabove with reference to Figs. 2–8.

[13171] VGAM944 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM944 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13172] VGAM944 gene, herein designated VGAM GENE, encodes a VGAM944 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM944 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM944 precursor RNA is designated SEQ ID:930, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:930 is located at position 97457 relative to the genome of Human herpesvirus 7.

[13173] VGAM944 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13174] An enzyme complex designated DICER COMPLEX, dices the VGAM944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM944 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM944 RNA is designated SEQ ID:3655, and is provided hereinbelow with reference to the sequence listing part.

[13175] VGAM944 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13176] VGAM944 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM944 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM944 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13177] The complementary binding of VGAM944 RNA, herein designated VGAM RNA, to host target binding sites on VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM944 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM944 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13178] It is appreciated that VGAM944 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM944 host target genes. The mRNA of each one of this plurality of VGAM944 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM944 RNA, herein designated VGAM

RNA, and which when bound by VGAM944 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM944 host target proteins.

[13179] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM944 gene, herein designated VGAM GENE, on one or more VGAM944 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13180] It is yet further appreciated that a function of VGAM944 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM944 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM944 correlate with, and may be deduced from, the identity of the host target genes which VGAM944 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13181] Nucleotide sequences of the VGAM944 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM944 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM944 are further described hereinbelow with reference to Table 1.

[13182] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM944 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13183] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 945 (VGAM945) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13184] VGAM945 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM945 was detected is described hereinabove with reference to Figs. 2–8.

[13185] VGAM945 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM945 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13186] VGAM945 gene, herein designated VGAM GENE, encodes a VGAM945 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM945 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM945 precursor RNA is designated SEQ ID:931, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:931 is located at position 98645 relative to

the genome of Human herpesvirus 7.

[13187] VGAM945 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13188] An enzyme complex designated DICER COMPLEX, dices the VGAM945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM945 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM945 RNA is designated SEQ ID:3656, and is provided hereinbelow with reference to the sequence listing part.

[13189] VGAM945 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13190] VGAM945 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM945 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM945 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13191] The complementary binding of VGAM945 RNA, herein designated VGAM RNA, to host target binding sites on VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM945 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM945 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13192] It is appreciated that VGAM945 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM945 host target genes. The mRNA of each one of this plurality of VGAM945 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM945 RNA, herein designated VGAM RNA, and which when bound by VGAM945 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM945 host target proteins.

[13193] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM945 gene, herein designated VGAM GENE, on one or more VGAM945 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13194] It is yet further appreciated that a function of VGAM945 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM945 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM945 correlate with, and may be deduced from, the identity of the host target genes which VGAM945 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13195] Nucleotide sequences of the VGAM945 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM945 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM945 are further described hereinbelow with reference to Table 1.

[13196] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM945 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13197] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 946 (VGAM946) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13198] VGAM946 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM946 was detected is described hereinabove with reference to Figs. 2–8.

[13199] VGAM946 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM946 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13200] VGAM946 gene, herein designated VGAM GENE, encodes a VGAM946 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM946 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM946 precursor RNA is designated SEQ ID:932, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:932 is located at position 80004 relative to the genome of Human herpesvirus 6.

[13201] VGAM946 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13202] An enzyme complex designated DICER COMPLEX, dices the VGAM946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM946 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM946 RNA is designated SEQ ID:3657, and is provided hereinbelow with reference to the sequence

listing part.

[13203] VGAM946 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13204] VGAM946 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM946 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM946 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13205] The complementary binding of VGAM946 RNA, herein designated VGAM RNA, to host target binding sites on VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM946 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM946 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13206] It is appreciated that VGAM946 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM946 host target genes. The mRNA of each one of this plurality of VGAM946 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM946 RNA, herein designated VGAM RNA, and which when bound by VGAM946 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM946 host target proteins.

[13207] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM946 gene, herein designated VGAM GENE, on one or more VGAM946 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13208] It is yet further appreciated that a function of VGAM946 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM946 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM946 correlate with, and may be deduced from, the identity of the host target genes which VGAM946 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13209] Nucleotide sequences of the VGAM946 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM946 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM946 are further described hereinbelow with reference to Table 1.

[13210] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM946 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13211] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 947 (VGAM947) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13212] VGAM947 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM947 was detected is described hereinabove with reference to Figs. 2–8.

[13213] VGAM947 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM947 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13214] VGAM947 gene, herein designated VGAM GENE, encodes a VGAM947 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM947 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM947 precursor RNA is designated SEQ ID:933, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:933 is located at position 76244 relative to the genome of Human herpesvirus 6.

[13215] VGAM947 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13216] An enzyme complex designated DICER COMPLEX, dices the VGAM947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM947 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM947 RNA is designated SEQ ID:3658, and

is provided hereinbelow with reference to the sequence listing part.

[13217] VGAM947 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13218] VGAM947 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM947 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM947 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13219] The complementary binding of VGAM947 RNA, herein designated VGAM RNA, to host target binding sites on VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM947 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM947 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13220] It is appreciated that VGAM947 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM947 host target genes. The mRNA of each one of this plurality of VGAM947 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM947 RNA, herein designated VGAM RNA, and which when bound by VGAM947 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM947 host target proteins.

[13221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM947 gene, herein designated VGAM GENE, on one or more VGAM947 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13222] It is yet further appreciated that a function of VGAM947 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM947 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM947 correlate with, and may be deduced from, the identity of the host target genes which VGAM947 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13223] Nucleotide sequences of the VGAM947 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM947 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM947 are further described hereinbelow with reference to Table 1.

[13224] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM947 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13225] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 948 (VGAM948) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13226] VGAM948 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM948 was detected is described hereinabove with reference to Figs. 2–8.

[13227] VGAM948 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carnation Italian ringspot virus. VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13228] VGAM948 gene, herein designated VGAM GENE, encodes a VGAM948 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM948 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM948 precursor RNA is

designated SEQ ID:934, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:934 is located at position 1710 relative to the genome of Carnation Italian ringspot virus.

[13229] VGAM948 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13230] An enzyme complex designated DICER COMPLEX, dices the VGAM948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM948 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide se-

quence of VGAM948 RNA is designated SEQ ID:3659, and is provided hereinbelow with reference to the sequence listing part.

[13231] VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13232] VGAM948 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM948 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM948 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13233] The complementary binding of VGAM948 RNA, herein designated VGAM RNA, to host target binding sites on VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM948 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM948 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13234] It is appreciated that VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM948 host target genes. The mRNA of

each one of this plurality of VGAM948 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM948 RNA, herein designated VGAM RNA, and which when bound by VGAM948 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM948 host target proteins.

[13235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM948 gene, herein designated VGAM GENE, on one or more VGAM948 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[13236] It is yet further appreciated that a function of VGAM948 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM948 include diagnosis, prevention and treatment of viral infection by Carnation Italian ringspot virus. Specific functions, and accordingly utilities, of VGAM948 correlate with, and may be deduced from, the identity of the host target genes which VGAM948 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13237] Nucleotide sequences of the VGAM948 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM948 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM948 are further described hereinbelow with reference to Table 1.

[13238] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM948 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[13239] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 949 (VGAM949) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13240] VGAM949 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM949 was detected is described hereinabove with reference to Figs. 2–8.

[13241] VGAM949 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carnation Italian ringspot virus. VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13242] VGAM949 gene, herein designated VGAM GENE, encodes a VGAM949 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM949 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM949 precursor RNA is designated SEQ ID:935, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:935 is located at position 2039 relative to the genome of Carnation Italian ringspot virus.

[13243] VGAM949 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13244] An enzyme complex designated DICER COMPLEX, dices the VGAM949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM949 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM949 RNA is designated SEQ ID:3660, and is provided hereinbelow with reference to the sequence listing part.

[13245] VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13246] VGAM949 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM949 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM949 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13247] The complementary binding of VGAM949 RNA, herein designated VGAM RNA, to host target binding sites on VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM949 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM949 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13248] It is appreciated that VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM949 host target genes. The mRNA of each one of this plurality of VGAM949 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM949 RNA, herein designated VGAM RNA, and which when bound by VGAM949 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM949 host target proteins.

[13249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM949 gene, herein designated VGAM GENE, on one or more VGAM949 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[13250] It is yet further appreciated that a function of VGAM949 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM949 include diagnosis, prevention and treatment of viral infection by Carnation Italian ringspot virus. Specific functions, and accordingly utilities, of VGAM949 correlate with, and may be deduced from, the identity of the host target genes which VGAM949 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13251] Nucleotide sequences of the VGAM949 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM949 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM949 are further described hereinbelow with reference to Table 1.

[13252] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM949 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13253] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 950 (VGAM950) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13254] VGAM950 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM950 was detected is described hereinabove with reference to Figs. 2–8.

[13255] VGAM950 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato bushy stunt virus. VGAM950 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13256] VGAM950 gene, herein designated VGAM GENE, encodes a VGAM950 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM950 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM950 precursor RNA is designated SEQ ID:936, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:936 is located at position 3278 relative to the genome of Tomato bushy stunt virus.

[13257] VGAM950 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13258] An enzyme complex designated DICER COMPLEX, dices the VGAM950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM950 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM950 RNA is designated SEQ ID:3661, and is provided hereinbelow with reference to the sequence listing part.

[13259] VGAM950 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13260] VGAM950 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM950 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM950 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13261] The complementary binding of VGAM950 RNA, herein designated VGAM RNA, to host target binding sites on VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM950 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM950 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13262] It is appreciated that VGAM950 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM950 host target genes. The mRNA of each one of this plurality of VGAM950 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM950 RNA, herein designated VGAM RNA, and which when bound by VGAM950 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM950 host target proteins.

[13263] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM950 gene, herein designated VGAM GENE, on one or more VGAM950 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13264] It is yet further appreciated that a function of VGAM950 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM950 include diagnosis, prevention and treatment of viral infection by Tomato bushy stunt virus. Specific functions, and accordingly utilities, of VGAM950 correlate with, and may be deduced from, the identity of the host target genes which VGAM950 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13265] Nucleotide sequences of the VGAM950 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM950 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM950 are further described hereinbelow with reference to Table 1.

[13266] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM950 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13267] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 951 (VGAM951) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13268] VGAM951 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM951 was detected is described hereinabove with reference to Figs. 2-8.

[13269] VGAM951 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato bushy stunt virus. VGAM951 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13270] VGAM951 gene, herein designated VGAM GENE, encodes a

VGAM951 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM951 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM951 precursor RNA is designated SEQ ID:937, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:937 is located at position 1675 relative to the genome of Tomato bushy stunt virus.

[13271] VGAM951 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13272] An enzyme complex designated DICER COMPLEX, dices the VGAM951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM951 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM951 RNA is designated SEQ ID:3662, and is provided hereinbelow with reference to the sequence listing part.

[13273] VGAM951 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13274] VGAM951 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM951 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM951 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13275] The complementary binding of VGAM951 RNA, herein designated VGAM RNA, to host target binding sites on VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM951 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM951 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13276] It is appreciated that VGAM951 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM951 host target genes. The mRNA of each one of this plurality of VGAM951 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM951 RNA, herein designated VGAM RNA, and which when bound by VGAM951 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM951 host target proteins.

[13277] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM951 gene, herein designated VGAM GENE, on one or more VGAM951 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13278] It is yet further appreciated that a function of VGAM951 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM951 include diagnosis, prevention and treatment of viral infection by Tomato bushy stunt virus. Specific functions, and accordingly utilities, of VGAM951 correlate with, and may be deduced from, the identity of the host target genes which VGAM951 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13279] Nucleotide sequences of the VGAM951 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM951 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM951 are further de-

scribed hereinbelow with reference to Table 1.

[13280] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM951 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13281] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 952 (VGAM952) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13282] VGAM952 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM952 was detected is described hereinabove with reference to Figs. 2-8.

[13283] VGAM952 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato bushy stunt virus. VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13284] VGAM952 gene, herein designated VGAM GENE, encodes a VGAM952 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM952 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM952 precursor RNA is designated SEQ ID:938, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:938 is located at position 3036 relative to the genome of Tomato bushy stunt virus.

[13285] VGAM952 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13286] An enzyme complex designated DICER COMPLEX, dices the VGAM952 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM952 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM952 RNA is designated SEQ ID:3663, and is provided hereinbelow with reference to the sequence listing part.

[13287] VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13288] VGAM952 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM952 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM952 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13289] The complementary binding of VGAM952 RNA, herein designated VGAM RNA, to host target binding sites on VGAM952 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM952 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM952 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13290] It is appreciated that VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM952 host target genes. The mRNA of each one of this plurality of VGAM952 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM952 RNA, herein designated VGAM RNA, and which when bound by VGAM952 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM952 host target proteins.

[13291] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM952 gene, herein designated VGAM GENE, on one or more VGAM952 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13292] It is yet further appreciated that a function of VGAM952 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM952 include diagnosis, prevention and treatment of viral infection by Tomato bushy stunt virus. Specific functions, and accordingly utilities, of VGAM952 correlate with, and may be deduced from, the identity of the host target genes which VGAM952 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13293] Nucleotide sequences of the VGAM952 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM952 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM952 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM952 are further described hereinbelow with reference to Table 1.

[13294] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM952 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13295] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 953 (VGAM953) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13296] VGAM953 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM953 was detected is described hereinabove with reference to Figs. 2-8.

[13297] VGAM953 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato spotted wilt virus. VGAM953 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[13298] VGAM953 gene, herein designated VGAM GENE, encodes a VGAM953 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM953 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM953 precursor RNA is designated SEQ ID:939, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:939 is located at position 3700 relative to the genome of Tomato spotted wilt virus.

[13299] VGAM953 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13300] An enzyme complex designated DICER COMPLEX, dices

the VGAM953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM953 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM953 RNA is designated SEQ ID:3664, and is provided hereinbelow with reference to the sequence listing part.

[13301] VGAM953 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13302] VGAM953 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM953 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM953 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM953 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13303] The complementary binding of VGAM953 RNA, herein designated VGAM RNA, to host target binding sites on VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM953 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM953 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13304] It is appreciated that VGAM953 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM953 host target genes. The mRNA of each one of this plurality of VGAM953 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM953 RNA, herein designated VGAM RNA, and which when bound by VGAM953 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM953 host target proteins.

[13305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM953 gene, herein designated VGAM GENE, on one or more VGAM953 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13306] It is yet further appreciated that a function of VGAM953 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM953 include diagnosis, prevention and treatment of viral infection by Tomato spotted wilt virus. Specific functions, and accordingly utilities, of VGAM953 correlate with, and may be deduced from, the identity of the host target genes which VGAM953 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13307] Nucleotide sequences of the VGAM953 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM953 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM953 are further described hereinbelow with reference to Table 1.

[13308] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM953 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13309] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 954 (VGAM954) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13310] VGAM954 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM954 was detected is described hereinabove with reference to Figs. 2-8.

[13311] VGAM954 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato spotted wilt virus. VGAM954 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13312] VGAM954 gene, herein designated VGAM GENE, encodes a VGAM954 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM954 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM954 precursor RNA is designated SEQ ID:940, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:940 is located at position 4634 relative to the genome of Tomato spotted wilt virus.

[13313] VGAM954 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13314] An enzyme complex designated DICER COMPLEX, dices the VGAM954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM954 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM954 RNA is designated SEQ ID:3665, and is provided hereinbelow with reference to the sequence listing part.

[13315] VGAM954 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13316] VGAM954 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM954 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM954 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13317] The complementary binding of VGAM954 RNA, herein designated VGAM RNA, to host target binding sites on VGAM954 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM954 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM954 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13318] It is appreciated that VGAM954 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM954 host target genes. The mRNA of each one of this plurality of VGAM954 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM954 RNA, herein designated VGAM RNA, and which when bound by VGAM954 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM954 host target proteins.

[13319] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM954 gene, herein designated VGAM GENE, on one or more VGAM954 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13320] It is yet further appreciated that a function of VGAM954 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM954 include diagnosis, prevention and treatment of viral infection by Tomato spotted wilt virus. Specific functions, and accordingly utilities, of VGAM954 correlate with, and may be deduced from, the identity of the host target genes which VGAM954 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13321] Nucleotide sequences of the VGAM954 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM954 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM954 are further described hereinbelow with reference to Table 1.

[13322] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM954 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13323] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 955 (VGAM955) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13324] VGAM955 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM955 was detected is described hereinabove with reference to Figs. 2-8.

[13325] VGAM955 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato spotted wilt

virus. VGAM955 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13326] VGAM955 gene, herein designated VGAM GENE, encodes a VGAM955 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM955 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM955 precursor RNA is designated SEQ ID:941, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:941 is located at position 4126 relative to the genome of Tomato spotted wilt virus.

[13327] VGAM955 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[13328] An enzyme complex designated DICER COMPLEX, dices the VGAM955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM955 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM955 RNA is designated SEQ ID:3666, and is provided hereinbelow with reference to the sequence listing part.

[13329] VGAM955 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13330] VGAM955 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM955 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM955 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13331] The complementary binding of VGAM955 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM955 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM955 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13332] It is appreciated that VGAM955 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM955 host target genes. The mRNA of each one of this plurality of VGAM955 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM955 RNA, herein designated VGAM RNA, and which when bound by VGAM955 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM955 host target proteins.

[13333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM955 gene, herein designated VGAM GENE, on one or more VGAM955 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13334] It is yet further appreciated that a function of VGAM955 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM955 include diagnosis, prevention and treatment of viral infection by Tomato spotted wilt virus. Specific functions, and accordingly utilities, of VGAM955 correlate with, and may be deduced from, the identity of the host target genes which VGAM955 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13335] Nucleotide sequences of the VGAM955 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM955 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM955 are further described hereinbelow with reference to Table 1.

[13336] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM955 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13337] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 956 (VGAM956) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13338] VGAM956 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM956 was detected is described hereinabove with reference to Figs. 2-8.

[13339] VGAM956 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tomato spotted wilt virus. VGAM956 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13340] VGAM956 gene, herein designated VGAM GENE, encodes a VGAM956 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM956 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM956 precursor RNA is designated SEQ ID:942, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:942 is located at position 3426 relative to the genome of Tomato spotted wilt virus.

[13341] VGAM956 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13342] An enzyme complex designated DICER COMPLEX, dices the VGAM956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM956 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM956 RNA is designated SEQ ID:3667, and is provided hereinbelow with reference to the sequence listing part.

[13343] VGAM956 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13344] VGAM956 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM956 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM956 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13345] The complementary binding of VGAM956 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM956 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM956 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13346] It is appreciated that VGAM956 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM956 host target genes. The mRNA of each one of this plurality of VGAM956 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM956 RNA, herein designated VGAM RNA, and which when bound by VGAM956 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM956 host target proteins.

[13347] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM956 gene, herein designated VGAM GENE, on one or more VGAM956 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13348] It is yet further appreciated that a function of VGAM956 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM956 include diagnosis, prevention and treatment of viral infection by Tomato spotted wilt virus. Specific functions, and accordingly utilities, of VGAM956 correlate with, and may be deduced from, the identity of the host target genes which VGAM956 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13349] Nucleotide sequences of the VGAM956 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM956 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM956 are further described hereinbelow with reference to Table 1.

[13350] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM956 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13351] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 957 (VGAM957) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13352] VGAM957 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM957 was detected is described hereinabove with reference to Figs. 2-8.

[13353] VGAM957 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato spotted wilt virus. VGAM957 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13354] VGAM957 gene, herein designated VGAM GENE, encodes a VGAM957 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM957 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM957 precursor RNA is designated SEQ ID:943, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:943 is located at position 704 relative to the genome of Tomato spotted wilt virus.

[13355] VGAM957 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13356] An enzyme complex designated DICER COMPLEX, dices the VGAM957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM957 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM957 RNA is designated SEQ ID:3668, and is provided hereinbelow with reference to the sequence listing part.

[13357] VGAM957 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[13358] VGAM957 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM957 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM957 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13359] The complementary binding of VGAM957 RNA, herein designated VGAM RNA, to host target binding sites on VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM957 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM957 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13360] It is appreciated that VGAM957 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM957 host target genes. The mRNA of each one of this plurality of VGAM957 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM957 RNA, herein designated VGAM RNA, and which when bound by VGAM957 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM957 host target proteins.

[13361] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM957 gene, herein designated VGAM GENE, on one or

more VGAM957 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13362] It is yet further appreciated that a function of VGAM957 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM957 include diagnosis, prevention and treatment of viral infection by Tomato spotted wilt virus. Specific functions, and accordingly utilities, of VGAM957 correlate with, and may be deduced from, the identity of the host target genes which VGAM957 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13363] Nucleotide sequences of the VGAM957 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM957 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM957 are further described hereinbelow with reference to Table 1.

[13364] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM957 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13365] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 958 (VGAM958) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13366] VGAM958 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM958 was detected is described

hereinabove with reference to Figs. 2–8.

[13367] VGAM958 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato spotted wilt virus. VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13368] VGAM958 gene, herein designated VGAM GENE, encodes a VGAM958 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM958 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM958 precursor RNA is designated SEQ ID:944, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:944 is located at position 2556 relative to the genome of Tomato spotted wilt virus.

[13369] VGAM958 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13370] An enzyme complex designated DICER COMPLEX, dices the VGAM958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM958 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM958 RNA is designated SEQ ID:3669, and is provided hereinbelow with reference to the sequence listing part.

[13371] VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13372] VGAM958 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM958 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM958 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[13373] The complementary binding of VGAM958 RNA, herein designated VGAM RNA, to host target binding sites on VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM958 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM958 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13374] It is appreciated that VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM958 host target genes. The mRNA of each one of this plurality of VGAM958 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM958 RNA, herein designated VGAM RNA, and which when bound by VGAM958 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM958 host target proteins.

[13375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM958 gene, herein designated VGAM GENE, on one or more VGAM958 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13376] It is yet further appreciated that a function of VGAM958 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM958 include diagnosis, prevention and treatment of viral infection by Tomato spotted wilt virus. Specific functions, and accordingly utilities, of VGAM958 correlate with, and may be deduced from, the identity of the host target genes which VGAM958 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[13377] Nucleotide sequences of the VGAM958 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM958 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM958 are further described hereinbelow with reference to Table 1.

[13378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM958 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13379] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 959 (VGAM959) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13380] VGAM959 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM959 was detected is described hereinabove with reference to Figs. 2–8.

[13381] VGAM959 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM959 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13382] VGAM959 gene, herein designated VGAM GENE, encodes a VGAM959 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM959 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM959 precursor RNA is designated SEQ ID:945, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:945 is located at position 24838 relative to the genome of lumpy skin disease virus.

[13383] VGAM959 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13384] An enzyme complex designated DICER COMPLEX, dices the VGAM959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM959 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM959 RNA is designated SEQ ID:3670, and is provided hereinbelow with reference to the sequence listing part.

[13385] VGAM959 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13386] VGAM959 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM959 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM959 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13387] The complementary binding of VGAM959 RNA, herein designated VGAM RNA, to host target binding sites on VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM959 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM959 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13388] It is appreciated that VGAM959 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM959 host target genes. The mRNA of each one of this plurality of VGAM959 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM959 RNA, herein designated VGAM RNA, and which when bound by VGAM959 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM959 host target proteins.

[13389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM959 gene, herein designated VGAM GENE, on one or more VGAM959 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13390] It is yet further appreciated that a function of VGAM959 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM959 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM959 correlate with, and may be deduced from, the identity of the host target genes which VGAM959 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[13391] Nucleotide sequences of the VGAM959 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM959 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM959 are further described hereinbelow with reference to Table 1.

[13392] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM959 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13393] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 960 (VGAM960) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13394] VGAM960 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM960 was detected is described hereinabove with reference to Figs. 2–8.

[13395] VGAM960 gene, herein designated VGAM GENE, is a viral gene contained in the genome of lumpy skin disease virus. VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13396] VGAM960 gene, herein designated VGAM GENE, encodes a VGAM960 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM960 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM960 precursor RNA is designated SEQ ID:946, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:946 is located at position 28243 relative to the genome of lumpy skin disease virus.

[13397] VGAM960 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13398] An enzyme complex designated DICER COMPLEX, dices the VGAM960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM960 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM960 RNA is designated SEQ ID:3671, and is provided hereinbelow with reference to the sequence listing part.

[13399] VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13400] VGAM960 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM960 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM960 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13401] The complementary binding of VGAM960 RNA, herein designated VGAM RNA, to host target binding sites on VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM960 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM960 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13402] It is appreciated that VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM960 host target genes. The mRNA of each one of this plurality of VGAM960 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM960 RNA, herein designated VGAM RNA, and which when bound by VGAM960 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM960 host target proteins.

[13403] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM960 gene, herein designated VGAM GENE, on one or more VGAM960 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13404] It is yet further appreciated that a function of VGAM960 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM960 include diagnosis, prevention and treatment of viral infection by lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM960 correlate with, and may be deduced from, the identity of

the host target genes which VGAM960 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13405] Nucleotide sequences of the VGAM960 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM960 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM960 are further described hereinbelow with reference to Table 1.

[13406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM960 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13407] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 961 (VGAM961) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13408] VGAM961 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM961 was detected is described hereinabove with reference to Figs. 2–8.

[13409] VGAM961 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.

VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13410] VGAM961 gene, herein designated VGAM GENE, encodes a VGAM961 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM961 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM961 precursor RNA is designated SEQ ID:947, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:947 is located at position 23299 relative to the genome of Goatpox virus.

[13411] VGAM961 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM961 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13412] An enzyme complex designated DICER COMPLEX, dices the VGAM961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM961 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM961 RNA is designated SEQ ID:3672, and is provided hereinbelow with reference to the sequence listing part.

[13413] VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM961 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13414] VGAM961 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM961 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM961 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13415] The complementary binding of VGAM961 RNA, herein designated VGAM RNA, to host target binding sites on VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM961 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM961 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13416] It is appreciated that VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM961 host target genes. The mRNA of each one of this plurality of VGAM961 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM961 RNA, herein designated VGAM RNA, and which when bound by VGAM961 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM961 host target proteins.

[13417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM961 gene, herein designated VGAM GENE, on one or more VGAM961 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13418] It is yet further appreciated that a function of VGAM961 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM961 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM961 correlate

with, and may be deduced from, the identity of the host target genes which VGAM961 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13419] Nucleotide sequences of the VGAM961 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM961 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM961 are further described hereinbelow with reference to Table 1.

[13420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM961 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13421] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 962 (VGAM962) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[13422] VGAM962 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM962 was detected is described hereinabove with reference to Figs. 2–8.

[13423] VGAM962 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM962 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13424] VGAM962 gene, herein designated VGAM GENE, encodes a VGAM962 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM962 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM962 precursor RNA is designated SEQ ID:948, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:948 is located at position 22678 relative to the genome of Meleagrid herpesvirus 1.

[13425] VGAM962 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM962 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13426] An enzyme complex designated DICER COMPLEX, dices the VGAM962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM962 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM962 RNA is designated SEQ ID:3673, and is provided hereinbelow with reference to the sequence listing part.

[13427] VGAM962 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM962 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13428] VGAM962 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM962 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM962 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13429] The complementary binding of VGAM962 RNA, herein designated VGAM RNA, to host target binding sites on VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM962 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM962 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13430] It is appreciated that VGAM962 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM962 host target genes. The mRNA of each one of this plurality of VGAM962 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM962 RNA, herein designated VGAM RNA, and which when bound by VGAM962 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM962 host target proteins.

[13431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM962 gene, herein designated VGAM GENE, on one or more VGAM962 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13432] It is yet further appreciated that a function of VGAM962 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM962 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM962 correlate with, and may be deduced from, the identity of the host target genes which VGAM962 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13433] Nucleotide sequences of the VGAM962 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM962 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM962 are further described hereinbelow with reference to Table 1.

[13434] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM962 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13435] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 963 (VGAM963) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[13436] VGAM963 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM963 was detected is described hereinabove with reference to Figs. 2–8.

[13437] VGAM963 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13438] VGAM963 gene, herein designated VGAM GENE, encodes a VGAM963 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM963 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM963 precursor RNA is designated SEQ ID:949, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:949 is located at position 20617 relative to the genome of Meleagrid herpesvirus 1.

[13439] VGAM963 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13440] An enzyme complex designated DICER COMPLEX, dices the VGAM963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM963 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM963 RNA is designated SEQ ID:3674, and is provided hereinbelow with reference to the sequence listing part.

[13441] VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13442] VGAM963 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM963 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM963 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM963 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13443] The complementary binding of VGAM963 RNA, herein designated VGAM RNA, to host target binding sites on VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM963 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM963 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13444] It is appreciated that VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM963 host target genes. The mRNA of each one of this plurality of VGAM963 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM963 RNA, herein designated VGAM RNA, and which when bound by VGAM963 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM963 host target proteins.

[13445] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM963 gene, herein designated VGAM GENE, on one or more VGAM963 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13446] It is yet further appreciated that a function of VGAM963 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM963 include diagnosis, prevention and

treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM963 correlate with, and may be deduced from, the identity of the host target genes which VGAM963 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13447] Nucleotide sequences of the VGAM963 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM963 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM963 are further described hereinbelow with reference to Table 1.

[13448] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM963 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13449] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 964 (VGAM964) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13450] VGAM964 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM964 was detected is described hereinabove with reference to Figs. 2–8.

[13451] VGAM964 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM964 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13452] VGAM964 gene, herein designated VGAM GENE, encodes a VGAM964 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM964 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM964 precursor RNA is designated SEQ ID:950, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:950 is located at position 22865 relative to the genome of Meleagrid herpesvirus 1.

[13453] VGAM964 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13454] An enzyme complex designated DICER COMPLEX, dices the VGAM964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM964 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM964 RNA is designated SEQ ID:3675, and is provided hereinbelow with reference to the sequence listing part.

[13455] VGAM964 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13456] VGAM964 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM964 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM964 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13457] The complementary binding of VGAM964 RNA, herein designated VGAM RNA, to host target binding sites on VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM964 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM964 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13458] It is appreciated that VGAM964 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM964 host target genes. The mRNA of each one of this plurality of VGAM964 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM964 RNA, herein designated VGAM

RNA, and which when bound by VGAM964 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM964 host target proteins.

[13459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM964 gene, herein designated VGAM GENE, on one or more VGAM964 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13460] It is yet further appreciated that a function of VGAM964 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM964 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM964 correlate with, and may be deduced from, the identity of the host target genes which VGAM964 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13461] Nucleotide sequences of the VGAM964 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM964 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM964 are further described hereinbelow with reference to Table 1.

[13462] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM964 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13463] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 965 (VGAM965) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13464] VGAM965 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM965 was detected is described hereinabove with reference to Figs. 2–8.

[13465] VGAM965 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM965 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13466] VGAM965 gene, herein designated VGAM GENE, encodes a VGAM965 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM965 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM965 precursor RNA is designated SEQ ID:951, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:951 is located at position 23173 relative to

the genome of Meleagrid herpesvirus 1.

[13467] VGAM965 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13468] An enzyme complex designated DICER COMPLEX, dices the VGAM965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM965 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM965 RNA is designated SEQ ID:3676, and is provided hereinbelow with reference to the sequence listing part.

[13469] VGAM965 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13470] VGAM965 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM965 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM965 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13471] The complementary binding of VGAM965 RNA, herein designated VGAM RNA, to host target binding sites on VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM965 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM965 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13472] It is appreciated that VGAM965 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM965 host target genes. The mRNA of each one of this plurality of VGAM965 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM965 RNA, herein designated VGAM RNA, and which when bound by VGAM965 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM965 host target proteins.

[13473] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM965 gene, herein designated VGAM GENE, on one or more VGAM965 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13474] It is yet further appreciated that a function of VGAM965 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM965 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM965 correlate with, and may be deduced from, the identity of the host target genes which VGAM965 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13475] Nucleotide sequences of the VGAM965 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM965 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM965 are further described hereinbelow with reference to Table 1.

[13476] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM965 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13477] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 966 (VGAM966) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13478] VGAM966 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM966 was detected is described hereinabove with reference to Figs. 2–8.

[13479] VGAM966 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13480] VGAM966 gene, herein designated VGAM GENE, encodes a VGAM966 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM966 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM966 precursor RNA is designated SEQ ID:952, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:952 is located at position 21558 relative to the genome of Meleagrid herpesvirus 1.

[13481] VGAM966 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13482] An enzyme complex designated DICER COMPLEX, dices the VGAM966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM966 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM966 RNA is designated SEQ ID:3677, and is provided hereinbelow with reference to the sequence

listing part.

[13483] VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13484] VGAM966 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM966 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM966 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13485] The complementary binding of VGAM966 RNA, herein designated VGAM RNA, to host target binding sites on VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM966 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM966 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13486] It is appreciated that VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM966 host target genes. The mRNA of each one of this plurality of VGAM966 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM966 RNA, herein designated VGAM RNA, and which when bound by VGAM966 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM966 host target proteins.

[13487] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM966 gene, herein designated VGAM GENE, on one or more VGAM966 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13488] It is yet further appreciated that a function of VGAM966 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM966 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM966 correlate with, and may be deduced from, the identity of the host target genes which VGAM966 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13489] Nucleotide sequences of the VGAM966 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM966 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM966 are further described hereinbelow with reference to Table 1.

[13490] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM966 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13491] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 967 (VGAM967) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13492] VGAM967 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM967 was detected is described hereinabove with reference to Figs. 2–8.

[13493] VGAM967 gene, herein designated VGAM GENE, is a viral gene contained in the genome of sheeppox virus. VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13494] VGAM967 gene, herein designated VGAM GENE, encodes a VGAM967 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM967 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM967 precursor RNA is designated SEQ ID:953, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:953 is located at position 26912 relative to the genome of sheeppox virus.

[13495] VGAM967 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13496] An enzyme complex designated DICER COMPLEX, dices the VGAM967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM967 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM967 RNA is designated SEQ ID:3678, and

is provided hereinbelow with reference to the sequence listing part.

[13497] VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13498] VGAM967 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM967 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM967 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13499] The complementary binding of VGAM967 RNA, herein designated VGAM RNA, to host target binding sites on VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM967 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM967 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13500] It is appreciated that VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM967 host target genes. The mRNA of each one of this plurality of VGAM967 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM967 RNA, herein designated VGAM RNA, and which when bound by VGAM967 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM967 host target proteins.

[13501] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM967 gene, herein designated VGAM GENE, on one or more VGAM967 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13502] It is yet further appreciated that a function of VGAM967 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM967 include diagnosis, prevention and treatment of viral infection by sheeppox virus. Specific functions, and accordingly utilities, of VGAM967 correlate with, and may be deduced from, the identity of the host target genes which VGAM967 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13503] Nucleotide sequences of the VGAM967 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM967 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM967 are further described hereinbelow with reference to Table 1.

[13504] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM967 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13505] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 968 (VGAM968) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13506] VGAM968 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM968 was detected is described hereinabove with reference to Figs. 2–8.

[13507] VGAM968 gene, herein designated VGAM GENE, is a viral gene contained in the genome of sheeppox virus. VGAM968 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13508] VGAM968 gene, herein designated VGAM GENE, encodes a VGAM968 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM968 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM968 precursor RNA is

designated SEQ ID:954, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:954 is located at position 24977 relative to the genome of sheeppox virus.

[13509] VGAM968 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13510] An enzyme complex designated DICER COMPLEX, dices the VGAM968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM968 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM968 RNA is designated SEQ ID:3679, and is provided hereinbelow with reference to the sequence listing part.

[13511] VGAM968 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13512] VGAM968 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM968 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM968 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13513] The complementary binding of VGAM968 RNA, herein designated VGAM RNA, to host target binding sites on VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM968 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM968 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13514] It is appreciated that VGAM968 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM968 host target genes. The mRNA of

each one of this plurality of VGAM968 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM968 RNA, herein designated VGAM RNA, and which when bound by VGAM968 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM968 host target proteins.

[13515] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM968 gene, herein designated VGAM GENE, on one or more VGAM968 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[13516] It is yet further appreciated that a function of VGAM968 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM968 include diagnosis, prevention and treatment of viral infection by sheeppox virus. Specific functions, and accordingly utilities, of VGAM968 correlate with, and may be deduced from, the identity of the host target genes which VGAM968 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13517] Nucleotide sequences of the VGAM968 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM968 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM968 are further described hereinbelow with reference to Table 1.

[13518] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM968 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[13519] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 969 (VGAM969) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13520] VGAM969 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM969 was detected is described hereinabove with reference to Figs. 2–8.

[13521] VGAM969 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Goatpox virus.

VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13522] VGAM969 gene, herein designated VGAM GENE, encodes a VGAM969 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM969 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM969 precursor RNA is designated SEQ ID:955, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:955 is located at position 25550 relative to the genome of Goatpox virus.

[13523] VGAM969 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13524] An enzyme complex designated DICER COMPLEX, dices the VGAM969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM969 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 56%) nucleotide sequence of VGAM969 RNA is designated SEQ ID:3680, and is provided hereinbelow with reference to the sequence listing part.

[13525] VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13526] VGAM969 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM969 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM969 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13527] The complementary binding of VGAM969 RNA, herein designated VGAM RNA, to host target binding sites on VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM969 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM969 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13528] It is appreciated that VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM969 host target genes. The mRNA of each one of this plurality of VGAM969 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM969 RNA, herein designated VGAM RNA, and which when bound by VGAM969 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM969 host target proteins.

[13529] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM969 gene, herein designated VGAM GENE, on one or more VGAM969 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[13530] It is yet further appreciated that a function of VGAM969 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM969 include diagnosis, prevention and treatment of viral infection by Goatpox virus. Specific functions, and accordingly utilities, of VGAM969 correlate with, and may be deduced from, the identity of the host target genes which VGAM969 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[13531] Nucleotide sequences of the VGAM969 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM969 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM969 are further described hereinbelow with reference to Table 1.

[13532] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM969 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13533] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 970 (VGAM970) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13534] VGAM970 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM970 was detected is described hereinabove with reference to Figs. 2–8.

[13535] VGAM970 gene, herein designated VGAM GENE, is a viral gene contained in the genome of sheeppox virus.

VGAM970 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13536] VGAM970 gene, herein designated VGAM GENE, encodes a VGAM970 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM970 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM970 precursor RNA is designated SEQ ID:956, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:956 is located at position 23426 relative to the genome of sheeppox virus.

[13537] VGAM970 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13538] An enzyme complex designated DICER COMPLEX, dices the VGAM970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM970 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM970 RNA is designated SEQ ID:3681, and is provided hereinbelow with reference to the sequence listing part.

[13539] VGAM970 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13540] VGAM970 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM970 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM970 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13541] The complementary binding of VGAM970 RNA, herein designated VGAM RNA, to host target binding sites on VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM970 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM970 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13542] It is appreciated that VGAM970 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM970 host target genes. The mRNA of each one of this plurality of VGAM970 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM970 RNA, herein designated VGAM RNA, and which when bound by VGAM970 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM970 host target proteins.

[13543] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM970 gene, herein designated VGAM GENE, on one or more VGAM970 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13544] It is yet further appreciated that a function of VGAM970 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM970 include diagnosis, prevention and treatment of viral infection by sheeppox virus. Specific functions, and accordingly utilities, of VGAM970 correlate with, and may be deduced from, the identity of the host target genes which VGAM970 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13545] Nucleotide sequences of the VGAM970 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM970 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM970 are further described hereinbelow with reference to Table 1.

[13546] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM970 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13547] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 971 (VGAM971) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13548] VGAM971 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM971 was detected is described hereinabove with reference to Figs. 2–8.

[13549] VGAM971 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13550] VGAM971 gene, herein designated VGAM GENE, encodes a VGAM971 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM971 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM971 precursor RNA is designated SEQ ID:957, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:957 is located at position 53540 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[13551] VGAM971 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13552] An enzyme complex designated DICER COMPLEX, dices the VGAM971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM971 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM971 RNA is designated SEQ ID:3682, and is provided hereinbelow with reference to the sequence listing part.

[13553] VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13554] VGAM971 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM971 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM971 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13555] The complementary binding of VGAM971 RNA, herein designated VGAM RNA, to host target binding sites on VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM971 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM971 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13556] It is appreciated that VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM971 host target genes. The mRNA of each one of this plurality of VGAM971 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM971 RNA, herein designated VGAM RNA, and which when bound by VGAM971 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM971 host target proteins.

[13557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM971 gene, herein designated VGAM GENE, on one or more VGAM971 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13558] It is yet further appreciated that a function of VGAM971 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM971 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM971 correlate with, and may be deduced from, the identity of the host target genes which VGAM971 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13559] Nucleotide sequences of the VGAM971 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM971 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM971 are further described hereinbelow with reference to Table 1.

[13560] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM971 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13561] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 972 (VGAM972) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13562] VGAM972 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM972 was detected is described hereinabove with reference to Figs. 2–8.

[13563] VGAM972 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13564] VGAM972 gene, herein designated VGAM GENE, encodes a VGAM972 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM972 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM972 precursor RNA is designated SEQ ID:958, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:958 is located at position 53651 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[13565] VGAM972 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13566] An enzyme complex designated DICER COMPLEX, dices the VGAM972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM972 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM972 RNA is designated SEQ ID:3683, and is provided hereinbelow with reference to the sequence listing part.

[13567] VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13568] VGAM972 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM972 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM972 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13569] The complementary binding of VGAM972 RNA, herein designated VGAM RNA, to host target binding sites on VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM972 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM972 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[13570] It is appreciated that VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM972 host target genes. The mRNA of each one of this plurality of VGAM972 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM972 RNA, herein designated VGAM RNA, and which when bound by VGAM972 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM972 host target proteins.

[13571] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM972 gene, herein designated VGAM GENE, on one or more VGAM972 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13572] It is yet further appreciated that a function of VGAM972 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM972 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM972 correlate with, and may be deduced from, the identity of the host target genes which VGAM972 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13573] Nucleotide sequences of the VGAM972 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM972 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM972 are further described hereinbelow with reference to Table 1.

[13574] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM972 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13575] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 973 (VGAM973) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13576] VGAM973 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM973 was detected is described hereinabove with reference to Figs. 2-8.

[13577] VGAM973 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13578] VGAM973 gene, herein designated VGAM GENE, encodes a VGAM973 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM973 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM973 precursor RNA is designated SEQ ID:959, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:959 is located at position 96169 relative to the genome of Equine herpesvirus 1.

[13579] VGAM973 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13580] An enzyme complex designated DICER COMPLEX, dices the VGAM973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM973 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM973 RNA is designated SEQ ID:3684, and is provided hereinbelow with reference to the sequence listing part.

[13581] VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13582] VGAM973 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM973 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM973 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13583] The complementary binding of VGAM973 RNA, herein designated VGAM RNA, to host target binding sites on VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM973 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM973 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13584] It is appreciated that VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM973 host target genes. The mRNA of each one of this plurality of VGAM973 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM973 RNA, herein designated VGAM RNA, and which when bound by VGAM973 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM973 host target proteins.

[13585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM973 gene, herein designated VGAM GENE, on one or more VGAM973 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13586] It is yet further appreciated that a function of VGAM973 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM973 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM973 correlate with, and may be deduced from, the identity of the host target genes which VGAM973 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13587] Nucleotide sequences of the VGAM973 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM973 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM973 are further described hereinbelow with reference to Table 1.

[13588] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM973 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13589] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 974 (VGAM974) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13590] VGAM974 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM974 was detected is described hereinabove with reference to Figs. 2-8.

[13591] VGAM974 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13592] VGAM974 gene, herein designated VGAM GENE, encodes a

VGAM974 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM974 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM974 precursor RNA is designated SEQ ID:960, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:960 is located at position 142776 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[13593] VGAM974 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13594] An enzyme complex designated DICER COMPLEX, dices the VGAM974 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM974 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM974 RNA is designated SEQ ID:3685, and is provided hereinbelow with reference to the sequence listing part.

[13595] VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13596] VGAM974 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM974 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM974 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13597] The complementary binding of VGAM974 RNA, herein designated VGAM RNA, to host target binding sites on VGAM974 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM974 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM974 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13598] It is appreciated that VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM974 host target genes. The mRNA of each one of this plurality of VGAM974 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM974 RNA, herein designated VGAM RNA, and which when bound by VGAM974 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM974 host target proteins.

[13599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM974 gene, herein designated VGAM GENE, on one or more VGAM974 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13600] It is yet further appreciated that a function of VGAM974 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM974 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM974 correlate with, and may be deduced from, the identity of the host target genes which VGAM974 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13601] Nucleotide sequences of the VGAM974 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM974 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM974 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM974 are further described hereinbelow with reference to Table 1.

[13602] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM974 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13603] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 975 (VGAM975) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13604] VGAM975 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM975 was detected is described hereinabove with reference to Figs. 2-8.

[13605] VGAM975 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13606] VGAM975 gene, herein designated VGAM GENE, encodes a VGAM975 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM975 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM975 precursor RNA is designated SEQ ID:961, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:961 is located at position 34911 relative to the genome of Variola virus.

[13607] VGAM975 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13608] An enzyme complex designated DICER COMPLEX, dices the VGAM975 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM975 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM975 RNA is designated SEQ ID:3686, and is provided hereinbelow with reference to the sequence listing part.

[13609] VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13610] VGAM975 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM975 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM975 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13611] The complementary binding of VGAM975 RNA, herein designated VGAM RNA, to host target binding sites on VGAM975 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM975 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM975 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13612] It is appreciated that VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM975 host target genes. The mRNA of each one of this plurality of VGAM975 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM975 RNA, herein designated VGAM RNA, and which when bound by VGAM975 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM975 host target proteins.

[13613] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM975 gene, herein designated VGAM GENE, on one or more VGAM975 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13614] It is yet further appreciated that a function of VGAM975 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM975 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM975 correlate with, and may be deduced from, the identity of the host target genes which VGAM975 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13615] Nucleotide sequences of the VGAM975 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM975 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM975 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM975 are further described hereinbelow with reference to Table 1.

[13616] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM975 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13617] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 976 (VGAM976) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13618] VGAM976 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM976 was detected is described hereinabove with reference to Figs. 2-8.

[13619] VGAM976 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM976 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[13620] VGAM976 gene, herein designated VGAM GENE, encodes a VGAM976 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM976 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM976 precursor RNA is designated SEQ ID:962, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:962 is located at position 48892 relative to the genome of Camelpox virus.

[13621] VGAM976 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13622] An enzyme complex designated DICER COMPLEX, dices

the VGAM976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM976 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM976 RNA is designated SEQ ID:3687, and is provided hereinbelow with reference to the sequence listing part.

[13623] VGAM976 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13624] VGAM976 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM976 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM976 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM976 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13625] The complementary binding of VGAM976 RNA, herein designated VGAM RNA, to host target binding sites on VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM976 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM976 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13626] It is appreciated that VGAM976 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM976 host target genes. The mRNA of each one of this plurality of VGAM976 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM976 RNA, herein designated VGAM RNA, and which when bound by VGAM976 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM976 host target proteins.

[13627] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM976 gene, herein designated VGAM GENE, on one or more VGAM976 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13628] It is yet further appreciated that a function of VGAM976 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM976 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM976 correlate with, and may be deduced from, the identity of the host target genes which VGAM976 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13629] Nucleotide sequences of the VGAM976 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM976 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM976 are further described hereinbelow with reference to Table 1.

[13630] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM976 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13631] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 977 (VGAM977) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13632] VGAM977 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM977 was detected is described hereinabove with reference to Figs. 2-8.

[13633] VGAM977 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM977 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[13634] VGAM977 gene, herein designated VGAM GENE, encodes a VGAM977 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM977 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM977 precursor RNA is designated SEQ ID:963, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:963 is located at position 38963 relative to the genome of Variola virus.

[13635] VGAM977 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13636] An enzyme complex designated DICER COMPLEX, dices

the VGAM977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM977 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM977 RNA is designated SEQ ID:3688, and is provided hereinbelow with reference to the sequence listing part.

[13637] VGAM977 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13638] VGAM977 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM977 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM977 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM977 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13639] The complementary binding of VGAM977 RNA, herein designated VGAM RNA, to host target binding sites on VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM977 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM977 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13640] It is appreciated that VGAM977 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM977 host target genes. The mRNA of each one of this plurality of VGAM977 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM977 RNA, herein designated VGAM RNA, and which when bound by VGAM977 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM977 host target proteins.

[13641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM977 gene, herein designated VGAM GENE, on one or more VGAM977 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13642] It is yet further appreciated that a function of VGAM977 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM977 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM977 correlate with, and may be deduced from, the identity of the host target genes which VGAM977 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13643] Nucleotide sequences of the VGAM977 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM977 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM977 are further described hereinbelow with reference to Table 1.

[13644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM977 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13645] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 978 (VGAM978) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13646] VGAM978 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM978 was detected is described hereinabove with reference to Figs. 2-8.

[13647] VGAM978 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM978 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[13648] VGAM978 gene, herein designated VGAM GENE, encodes a VGAM978 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM978 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM978 precursor RNA is designated SEQ ID:964, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:964 is located at position 55420 relative to the genome of Ectromelia virus.

[13649] VGAM978 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13650] An enzyme complex designated DICER COMPLEX, dices the VGAM978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM978 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM978 RNA is designated SEQ ID:3689, and is provided hereinbelow with reference to the sequence listing part.

[13651] VGAM978 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13652] VGAM978 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM978 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM978 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13653] The complementary binding of VGAM978 RNA, herein designated VGAM RNA, to host target binding sites on VGAM978 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM978 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM978 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13654] It is appreciated that VGAM978 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM978 host target genes. The mRNA of each one of this plurality of VGAM978 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM978 RNA, herein designated VGAM RNA, and which when bound by VGAM978 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM978 host target proteins.

[13655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM978 gene, herein designated VGAM GENE, on one or more VGAM978 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13656] It is yet further appreciated that a function of VGAM978 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM978 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM978 correlate with, and may be deduced from, the identity of the host target genes which VGAM978 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13657] Nucleotide sequences of the VGAM978 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM978 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM978 are further described hereinbelow with reference to Table 1.

[13658] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM978 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13659] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 979 (VGAM979) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13660] VGAM979 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM979 was detected is described hereinabove with reference to Figs. 2-8.

[13661] VGAM979 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13662] VGAM979 gene, herein designated VGAM GENE, encodes a VGAM979 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM979 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM979 precursor RNA is designated SEQ ID:965, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:965 is located at position 50081 relative to the genome of Camelpox virus.

[13663] VGAM979 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[13664] An enzyme complex designated DICER COMPLEX, dices the VGAM979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM979 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM979 RNA is designated SEQ ID:3690, and is provided hereinbelow with reference to the sequence listing part.

[13665] VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13666] VGAM979 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM979 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM979 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13667] The complementary binding of VGAM979 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM979 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM979 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13668] It is appreciated that VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM979 host target genes. The mRNA of each one of this plurality of VGAM979 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM979 RNA, herein designated VGAM RNA, and which when bound by VGAM979 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM979 host target proteins.

[13669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM979 gene, herein designated VGAM GENE, on one or more VGAM979 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13670] It is yet further appreciated that a function of VGAM979 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM979 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM979 correlate with, and may be deduced from, the identity of the host target genes which VGAM979 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13671] Nucleotide sequences of the VGAM979 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM979 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM979 are further described hereinbelow with reference to Table 1.

[13672] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM979 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13673] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 980 (VGAM980) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13674] VGAM980 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM980 was detected is described hereinabove with reference to Figs. 2-8.

[13675] VGAM980 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ectromelia virus.

VGAM980 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13676] VGAM980 gene, herein designated VGAM GENE, encodes a VGAM980 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM980 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM980 precursor RNA is designated SEQ ID:966, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:966 is located at position 54779 relative to the genome of Ectromelia virus.

[13677] VGAM980 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13678] An enzyme complex designated DICER COMPLEX, dices the VGAM980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM980 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM980 RNA is designated SEQ ID:3691, and is provided hereinbelow with reference to the sequence listing part.

[13679] VGAM980 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13680] VGAM980 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM980 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM980 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13681] The complementary binding of VGAM980 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM980 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM980 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13682] It is appreciated that VGAM980 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM980 host target genes. The mRNA of each one of this plurality of VGAM980 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM980 RNA, herein designated VGAM RNA, and which when bound by VGAM980 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM980 host target proteins.

[13683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM980 gene, herein designated VGAM GENE, on one or more VGAM980 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13684] It is yet further appreciated that a function of VGAM980 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM980 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM980 correlate with, and may be deduced from, the identity of the host target genes which VGAM980 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13685] Nucleotide sequences of the VGAM980 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM980 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM980 are further described hereinbelow with reference to Table 1.

[13686] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM980 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13687] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 981 (VGAM981) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13688] VGAM981 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM981 was detected is described hereinabove with reference to Figs. 2-8.

[13689] VGAM981 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM981 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13690] VGAM981 gene, herein designated VGAM GENE, encodes a VGAM981 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM981 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM981 precursor RNA is designated SEQ ID:967, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:967 is located at position 62393 relative to the genome of Cowpox virus.

[13691] VGAM981 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13692] An enzyme complex designated DICER COMPLEX, dices the VGAM981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM981 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM981 RNA is designated SEQ ID:3692, and is provided hereinbelow with reference to the sequence listing part.

[13693] VGAM981 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13694] VGAM981 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM981 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM981 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13695] The complementary binding of VGAM981 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM981 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM981 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13696] It is appreciated that VGAM981 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM981 host target genes. The mRNA of each one of this plurality of VGAM981 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM981 RNA, herein designated VGAM RNA, and which when bound by VGAM981 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM981 host target proteins.

[13697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM981 gene, herein designated VGAM GENE, on one or more VGAM981 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13698] It is yet further appreciated that a function of VGAM981 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM981 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM981 correlate with, and may be deduced from, the identity of the host target genes which VGAM981 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13699] Nucleotide sequences of the VGAM981 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM981 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM981 are further described hereinbelow with reference to Table 1.

[13700] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM981 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13701] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 982 (VGAM982) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13702] VGAM982 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM982 was detected is described hereinabove with reference to Figs. 2-8.

[13703] VGAM982 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM982 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13704] VGAM982 gene, herein designated VGAM GENE, encodes a VGAM982 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM982 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM982 precursor RNA is designated SEQ ID:968, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:968 is located at position 54629 relative to the genome of Ectromelia virus.

[13705] VGAM982 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13706] An enzyme complex designated DICER COMPLEX, dices the VGAM982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM982 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM982 RNA is designated SEQ ID:3693, and is provided hereinbelow with reference to the sequence listing part.

[13707] VGAM982 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[13708] VGAM982 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM982 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM982 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13709] The complementary binding of VGAM982 RNA, herein designated VGAM RNA, to host target binding sites on VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM982 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM982 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13710] It is appreciated that VGAM982 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM982 host target genes. The mRNA of each one of this plurality of VGAM982 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM982 RNA, herein designated VGAM RNA, and which when bound by VGAM982 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM982 host target proteins.

[13711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM982 gene, herein designated VGAM GENE, on one or

more VGAM982 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13712] It is yet further appreciated that a function of VGAM982 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM982 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM982 correlate with, and may be deduced from, the identity of the host target genes which VGAM982 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13713] Nucleotide sequences of the VGAM982 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM982 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM982 are further described hereinbelow with reference to Table 1.

[13714] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM982 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13715] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 983 (VGAM983) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13716] VGAM983 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM983 was detected is described

hereinabove with reference to Figs. 2–8.

[13717] VGAM983 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus.

VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13718] VGAM983 gene, herein designated VGAM GENE, encodes a VGAM983 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM983 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM983 precursor RNA is designated SEQ ID:969, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:969 is located at position 54050 relative to the genome of Ectromelia virus.

[13719] VGAM983 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13720] An enzyme complex designated DICER COMPLEX, dices the VGAM983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM983 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM983 RNA is designated SEQ ID:3694, and is provided hereinbelow with reference to the sequence listing part.

[13721] VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13722] VGAM983 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM983 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM983 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[13723] The complementary binding of VGAM983 RNA, herein designated VGAM RNA, to host target binding sites on VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM983 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM983 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13724] It is appreciated that VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM983 host target genes. The mRNA of each one of this plurality of VGAM983 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM983 RNA, herein designated VGAM RNA, and which when bound by VGAM983 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM983 host target proteins.

[13725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM983 gene, herein designated VGAM GENE, on one or more VGAM983 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13726] It is yet further appreciated that a function of VGAM983 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM983 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM983 correlate with, and may be deduced from, the identity of the host target genes which VGAM983 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[13727] Nucleotide sequences of the VGAM983 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM983 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM983 are further described hereinbelow with reference to Table 1.

[13728] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM983 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13729] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 984 (VGAM984) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13730] VGAM984 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM984 was detected is described hereinabove with reference to Figs. 2–8.

[13731] VGAM984 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13732] VGAM984 gene, herein designated VGAM GENE, encodes a VGAM984 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM984 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM984 precursor RNA is designated SEQ ID:970, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:970 is located at position 64055 relative to the genome of Cowpox virus.

[13733] VGAM984 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13734] An enzyme complex designated DICER COMPLEX, dices the VGAM984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM984 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM984 RNA is designated SEQ ID:3695, and is provided hereinbelow with reference to the sequence listing part.

[13735] VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13736] VGAM984 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM984 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM984 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[13737] The complementary binding of VGAM984 RNA, herein designated VGAM RNA, to host target binding sites on VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM984 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM984 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13738] It is appreciated that VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM984 host target genes. The mRNA of each one of this plurality of VGAM984 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM984 RNA, herein designated VGAM RNA, and which when bound by VGAM984 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM984 host target proteins.

[13739] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM984 gene, herein designated VGAM GENE, on one or more VGAM984 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13740] It is yet further appreciated that a function of VGAM984 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM984 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM984 correlate with, and may be deduced from, the identity of the host target genes which VGAM984 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[13741] Nucleotide sequences of the VGAM984 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM984 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM984 are further described hereinbelow with reference to Table 1.

[13742] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM984 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13743] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 985 (VGAM985) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13744] VGAM985 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM985 was detected is described hereinabove with reference to Figs. 2–8.

[13745] VGAM985 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13746] VGAM985 gene, herein designated VGAM GENE, encodes a VGAM985 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM985 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM985 precursor RNA is designated SEQ ID:971, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:971 is located at position 26086 relative to the genome of Human herpesvirus 3.

[13747] VGAM985 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13748] An enzyme complex designated DICER COMPLEX, dices the VGAM985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM985 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM985 RNA is designated SEQ ID:3696, and is provided hereinbelow with reference to the sequence listing part.

[13749] VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13750] VGAM985 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM985 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM985 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13751] The complementary binding of VGAM985 RNA, herein designated VGAM RNA, to host target binding sites on VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM985 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM985 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13752] It is appreciated that VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM985 host target genes. The mRNA of each one of this plurality of VGAM985 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM985 RNA, herein designated VGAM RNA, and which when bound by VGAM985 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM985 host target proteins.

[13753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM985 gene, herein designated VGAM GENE, on one or more VGAM985 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13754] It is yet further appreciated that a function of VGAM985 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM985 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM985 correlate with, and may be deduced from, the identity of the host target genes which VGAM985 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[13755] Nucleotide sequences of the VGAM985 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM985 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM985 are further described hereinbelow with reference to Table 1.

[13756] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM985 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13757] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 986 (VGAM986) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13758] VGAM986 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM986 was detected is described hereinabove with reference to Figs. 2–8.

[13759] VGAM986 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–4. VGAM986 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13760] VGAM986 gene, herein designated VGAM GENE, encodes a VGAM986 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM986 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM986 precursor RNA is designated SEQ ID:972, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:972 is located at position 377 relative to the genome of Leishmania RNA virus 1–4.

[13761] VGAM986 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13762] An enzyme complex designated DICER COMPLEX, dices the VGAM986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM986 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM986 RNA is designated SEQ ID:3697, and is provided hereinbelow with reference to the sequence listing part.

[13763] VGAM986 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13764] VGAM986 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM986 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM986 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13765] The complementary binding of VGAM986 RNA, herein designated VGAM RNA, to host target binding sites on VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM986 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM986 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13766] It is appreciated that VGAM986 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM986 host target genes. The mRNA of each one of this plurality of VGAM986 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM986 RNA, herein designated VGAM RNA, and which when bound by VGAM986 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM986 host target proteins.

[13767] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM986 gene, herein designated VGAM GENE, on one or more VGAM986 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13768] It is yet further appreciated that a function of VGAM986 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM986 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-4. Specific functions, and accordingly utilities, of VGAM986 correlate with, and may be deduced from, the identity of

the host target genes which VGAM986 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13769] Nucleotide sequences of the VGAM986 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM986 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM986 are further described hereinbelow with reference to Table 1.

[13770] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM986 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13771] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 987 (VGAM987) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13772] VGAM987 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM987 was detected is described hereinabove with reference to Figs. 2–8.

[13773] VGAM987 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–4. VGAM987 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13774] VGAM987 gene, herein designated VGAM GENE, encodes a VGAM987 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM987 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM987 precursor RNA is designated SEQ ID:973, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:973 is located at position 1955 relative to the genome of Leishmania RNA virus 1–4.

[13775] VGAM987 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM987 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13776] An enzyme complex designated DICER COMPLEX, dices the VGAM987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM987 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM987 RNA is designated SEQ ID:3698, and is provided hereinbelow with reference to the sequence listing part.

[13777] VGAM987 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM987 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13778] VGAM987 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM987 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM987 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13779] The complementary binding of VGAM987 RNA, herein designated VGAM RNA, to host target binding sites on VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM987 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM987 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13780] It is appreciated that VGAM987 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM987 host target genes. The mRNA of each one of this plurality of VGAM987 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM987 RNA, herein designated VGAM RNA, and which when bound by VGAM987 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM987 host target proteins.

[13781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM987 gene, herein designated VGAM GENE, on one or more VGAM987 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13782] It is yet further appreciated that a function of VGAM987 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM987 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-4. Specific functions, and accordingly utilities, of VGAM987

correlate with, and may be deduced from, the identity of the host target genes which VGAM987 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13783] Nucleotide sequences of the VGAM987 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM987 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM987 are further described hereinbelow with reference to Table 1.

[13784] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM987 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13785] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 988 (VGAM988) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[13786] VGAM988 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM988 was detected is described hereinabove with reference to Figs. 2–8.

[13787] VGAM988 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–4. VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13788] VGAM988 gene, herein designated VGAM GENE, encodes a VGAM988 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM988 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM988 precursor RNA is designated SEQ ID:974, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:974 is located at position 2513 relative to the genome of Leishmania RNA virus 1–4.

[13789] VGAM988 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM988 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13790] An enzyme complex designated DICER COMPLEX, dices the VGAM988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM988 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM988 RNA is designated SEQ ID:3699, and is provided hereinbelow with reference to the sequence listing part.

[13791] VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM988 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13792] VGAM988 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM988 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM988 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13793] The complementary binding of VGAM988 RNA, herein designated VGAM RNA, to host target binding sites on VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM988 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM988 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13794] It is appreciated that VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM988 host target genes. The mRNA of each one of this plurality of VGAM988 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM988 RNA, herein designated VGAM RNA, and which when bound by VGAM988 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM988 host target proteins.

[13795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM988 gene, herein designated VGAM GENE, on one or more VGAM988 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13796] It is yet further appreciated that a function of VGAM988 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM988 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-4.

Specific functions, and accordingly utilities, of VGAM988 correlate with, and may be deduced from, the identity of the host target genes which VGAM988 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13797] Nucleotide sequences of the VGAM988 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM988 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM988 are further described hereinbelow with reference to Table 1.

[13798] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM988 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13799] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 989 (VGAM989) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[13800] VGAM989 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM989 was detected is described hereinabove with reference to Figs. 2–8.

[13801] VGAM989 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–4. VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13802] VGAM989 gene, herein designated VGAM GENE, encodes a VGAM989 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM989 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM989 precursor RNA is designated SEQ ID:975, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:975 is located at position 1535 relative to the genome of Leishmania RNA virus 1–4.

[13803] VGAM989 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13804] An enzyme complex designated DICER COMPLEX, dices the VGAM989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM989 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM989 RNA is designated SEQ ID:3700, and is provided hereinbelow with reference to the sequence listing part.

[13805] VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13806] VGAM989 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM989 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM989 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM989 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13807] The complementary binding of VGAM989 RNA, herein designated VGAM RNA, to host target binding sites on VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM989 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM989 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13808] It is appreciated that VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM989 host target genes. The mRNA of each one of this plurality of VGAM989 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM989 RNA, herein designated VGAM RNA, and which when bound by VGAM989 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM989 host target proteins.

[13809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM989 gene, herein designated VGAM GENE, on one or more VGAM989 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13810] It is yet further appreciated that a function of VGAM989 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM989 include diagnosis, prevention and

treatment of viral infection by Leishmania RNA virus 1–4. Specific functions, and accordingly utilities, of VGAM989 correlate with, and may be deduced from, the identity of the host target genes which VGAM989 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13811] Nucleotide sequences of the VGAM989 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM989 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM989 are further described hereinbelow with reference to Table 1.

[13812] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM989 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13813] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 990 (VGAM990) viral gene, which modulates ex–

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13814] VGAM990 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM990 was detected is described hereinabove with reference to Figs. 2–8.

[13815] VGAM990 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–4. VGAM990 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13816] VGAM990 gene, herein designated VGAM GENE, encodes a VGAM990 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM990 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM990 precursor RNA is designated SEQ ID:976, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:976 is located at position 5193 relative to the genome of Leishmania RNA virus 1–4.

[13817] VGAM990 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13818] An enzyme complex designated DICER COMPLEX, dices the VGAM990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM990 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM990 RNA is designated SEQ ID:3701, and is provided hereinbelow with reference to the sequence listing part.

[13819] VGAM990 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13820] VGAM990 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM990 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM990 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13821] The complementary binding of VGAM990 RNA, herein designated VGAM RNA, to host target binding sites on VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM990 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM990 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13822] It is appreciated that VGAM990 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM990 host target genes. The mRNA of each one of this plurality of VGAM990 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM990 RNA, herein designated VGAM

RNA, and which when bound by VGAM990 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM990 host target proteins.

[13823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM990 gene, herein designated VGAM GENE, on one or more VGAM990 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13824] It is yet further appreciated that a function of VGAM990 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM990 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1–4. Specific functions, and accordingly utilities, of VGAM990 correlate with, and may be deduced from, the identity of the host target genes which VGAM990 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13825] Nucleotide sequences of the VGAM990 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM990 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM990 are further described hereinbelow with reference to Table 1.

[13826] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM990 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13827] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes–

senger 991 (VGAM991) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13828] VGAM991 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM991 was detected is described hereinabove with reference to Figs. 2–8.

[13829] VGAM991 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–1. VGAM991 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13830] VGAM991 gene, herein designated VGAM GENE, encodes a VGAM991 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM991 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM991 precursor RNA is designated SEQ ID:977, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:977 is located at position 390 relative to

the genome of Leishmania RNA virus 1-1.

[13831] VGAM991 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13832] An enzyme complex designated DICER COMPLEX, dices the VGAM991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM991 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM991 RNA is designated SEQ ID:3702, and is provided hereinbelow with reference to the sequence listing part.

[13833] VGAM991 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13834] VGAM991 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM991 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM991 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13835] The complementary binding of VGAM991 RNA, herein designated VGAM RNA, to host target binding sites on VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM991 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM991 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13836] It is appreciated that VGAM991 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM991 host target genes. The mRNA of each one of this plurality of VGAM991 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM991 RNA, herein designated VGAM RNA, and which when bound by VGAM991 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM991 host target proteins.

[13837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM991 gene, herein designated VGAM GENE, on one or more VGAM991 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13838] It is yet further appreciated that a function of VGAM991 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM991 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-1. Specific functions, and accordingly utilities, of VGAM991 correlate with, and may be deduced from, the identity of the host target genes which VGAM991 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13839] Nucleotide sequences of the VGAM991 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM991 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM991 are further described hereinbelow with reference to Table 1.

[13840] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM991 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13841] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 992 (VGAM992) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13842] VGAM992 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM992 was detected is described hereinabove with reference to Figs. 2–8.

[13843] VGAM992 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–1. VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13844] VGAM992 gene, herein designated VGAM GENE, encodes a VGAM992 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM992 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM992 precursor RNA is designated SEQ ID:978, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:978 is located at position 3813 relative to the genome of Leishmania RNA virus 1-1.

[13845] VGAM992 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13846] An enzyme complex designated DICER COMPLEX, dices the VGAM992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM992 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM992 RNA is designated SEQ ID:3703, and is provided hereinbelow with reference to the sequence

listing part.

[13847] VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13848] VGAM992 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM992 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM992 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13849] The complementary binding of VGAM992 RNA, herein designated VGAM RNA, to host target binding sites on VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM992 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM992 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13850] It is appreciated that VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM992 host target genes. The mRNA of each one of this plurality of VGAM992 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM992 RNA, herein designated VGAM RNA, and which when bound by VGAM992 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM992 host target proteins.

[13851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM992 gene, herein designated VGAM GENE, on one or more VGAM992 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13852] It is yet further appreciated that a function of VGAM992 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM992 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-1. Specific functions, and accordingly utilities, of VGAM992 correlate with, and may be deduced from, the identity of the host target genes which VGAM992 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13853] Nucleotide sequences of the VGAM992 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM992 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM992 are further described hereinbelow with reference to Table 1.

[13854] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM992 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13855] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 993 (VGAM993) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13856] VGAM993 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM993 was detected is described hereinabove with reference to Figs. 2–8.

[13857] VGAM993 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–1. VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13858] VGAM993 gene, herein designated VGAM GENE, encodes a VGAM993 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM993 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM993 precursor RNA is designated SEQ ID:979, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:979 is located at position 4662 relative to the genome of Leishmania RNA virus 1-1.

[13859] VGAM993 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13860] An enzyme complex designated DICER COMPLEX, dices the VGAM993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM993 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM993 RNA is designated SEQ ID:3704, and

is provided hereinbelow with reference to the sequence listing part.

[13861] VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13862] VGAM993 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM993 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM993 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13863] The complementary binding of VGAM993 RNA, herein designated VGAM RNA, to host target binding sites on VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM993 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM993 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13864] It is appreciated that VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM993 host target genes. The mRNA of each one of this plurality of VGAM993 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM993 RNA, herein designated VGAM RNA, and which when bound by VGAM993 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM993 host target proteins.

[13865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM993 gene, herein designated VGAM GENE, on one or more VGAM993 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13866] It is yet further appreciated that a function of VGAM993 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM993 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-1. Specific functions, and accordingly utilities, of VGAM993 correlate with, and may be deduced from, the identity of the host target genes which VGAM993 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13867] Nucleotide sequences of the VGAM993 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM993 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM993 are further described hereinbelow with reference to Table 1.

[13868] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM993 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13869] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 994 (VGAM994) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13870] VGAM994 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM994 was detected is described hereinabove with reference to Figs. 2–8.

[13871] VGAM994 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–1. VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13872] VGAM994 gene, herein designated VGAM GENE, encodes a VGAM994 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM994 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM994 precursor RNA is

designated SEQ ID:980, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:980 is located at position 4299 relative to the genome of Leishmania RNA virus 1-1.

[13873] VGAM994 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13874] An enzyme complex designated DICER COMPLEX, dices the VGAM994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM994 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM994 RNA is designated SEQ ID:3705, and is provided hereinbelow with reference to the sequence listing part.

[13875] VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13876] VGAM994 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM994 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM994 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13877] The complementary binding of VGAM994 RNA, herein designated VGAM RNA, to host target binding sites on VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM994 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM994 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13878] It is appreciated that VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM994 host target genes. The mRNA of

each one of this plurality of VGAM994 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM994 RNA, herein designated VGAM RNA, and which when bound by VGAM994 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM994 host target proteins.

[13879] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM994 gene, herein designated VGAM GENE, on one or more VGAM994 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[13880] It is yet further appreciated that a function of VGAM994 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM994 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-1. Specific functions, and accordingly utilities, of VGAM994 correlate with, and may be deduced from, the identity of the host target genes which VGAM994 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13881] Nucleotide sequences of the VGAM994 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM994 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM994 are further described hereinbelow with reference to Table 1.

[13882] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM994 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[13883] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 995 (VGAM995) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13884] VGAM995 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM995 was detected is described hereinabove with reference to Figs. 2–8.

[13885] VGAM995 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–1. VGAM995 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13886] VGAM995 gene, herein designated VGAM GENE, encodes a VGAM995 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM995 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM995 precursor RNA is designated SEQ ID:981, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:981 is located at position 4489 relative to the genome of Leishmania RNA virus 1-1.

[13887] VGAM995 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13888] An enzyme complex designated DICER COMPLEX, dices the VGAM995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM995 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM995 RNA is designated SEQ ID:3706, and is provided hereinbelow with reference to the sequence listing part.

[13889] VGAM995 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13890] VGAM995 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM995 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM995 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13891] The complementary binding of VGAM995 RNA, herein designated VGAM RNA, to host target binding sites on VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM995 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM995 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13892] It is appreciated that VGAM995 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM995 host target genes. The mRNA of each one of this plurality of VGAM995 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM995 RNA, herein designated VGAM RNA, and which when bound by VGAM995 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM995 host target proteins.

[13893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM995 gene, herein designated VGAM GENE, on one or more VGAM995 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[13894] It is yet further appreciated that a function of VGAM995 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM995 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-1. Specific functions, and accordingly utilities, of VGAM995 correlate with, and may be deduced from, the identity of the host target genes which VGAM995 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13895] Nucleotide sequences of the VGAM995 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM995 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM995 are further described hereinbelow with reference to Table 1.

[13896] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM995 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13897] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 996 (VGAM996) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13898] VGAM996 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM996 was detected is described hereinabove with reference to Figs. 2–8.

[13899] VGAM996 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 1–1. VGAM996 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13900] VGAM996 gene, herein designated VGAM GENE, encodes a VGAM996 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM996 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM996 precursor RNA is designated SEQ ID:982, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:982 is located at position 3625 relative to the genome of Leishmania RNA virus 1-1.

[13901] VGAM996 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13902] An enzyme complex designated DICER COMPLEX, dices the VGAM996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM996 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM996 RNA is designated SEQ ID:3707, and is provided hereinbelow with reference to the sequence listing part.

[13903] VGAM996 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13904] VGAM996 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM996 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM996 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13905] The complementary binding of VGAM996 RNA, herein designated VGAM RNA, to host target binding sites on VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM996 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM996 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13906] It is appreciated that VGAM996 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM996 host target genes. The mRNA of each one of this plurality of VGAM996 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM996 RNA, herein designated VGAM RNA, and which when bound by VGAM996 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM996 host target proteins.

[13907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM996 gene, herein designated VGAM GENE, on one or more VGAM996 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13908] It is yet further appreciated that a function of VGAM996 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM996 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 1-1. Specific functions, and accordingly utilities, of VGAM996 correlate with, and may be deduced from, the identity of the host target genes which VGAM996 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13909] Nucleotide sequences of the VGAM996 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM996 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM996 are further described hereinbelow with reference to Table 1.

[13910] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM996 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13911] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 997 (VGAM997) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13912] VGAM997 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM997 was detected is described hereinabove with reference to Figs. 2–8.

[13913] VGAM997 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM997 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13914] VGAM997 gene, herein designated VGAM GENE, encodes a VGAM997 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM997 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM997 precursor RNA is designated SEQ ID:983, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:983 is located at position 65867 relative to the genome of Cowpox virus.

[13915] VGAM997 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13916] An enzyme complex designated DICER COMPLEX, dices the VGAM997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM997 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM997 RNA is designated SEQ ID:3708, and is provided hereinbelow with reference to the sequence listing part.

[13917] VGAM997 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13918] VGAM997 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM997 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM997 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13919] The complementary binding of VGAM997 RNA, herein designated VGAM RNA, to host target binding sites on VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM997 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM997 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13920] It is appreciated that VGAM997 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM997 host target genes. The mRNA of each one of this plurality of VGAM997 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM997 RNA, herein designated VGAM RNA, and which when bound by VGAM997 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM997 host target proteins.

[13921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM997 gene, herein designated VGAM GENE, on one or more VGAM997 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13922] It is yet further appreciated that a function of VGAM997 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM997 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM997 correlate with, and may be deduced from, the identity of the host target genes which VGAM997 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13923] Nucleotide sequences of the VGAM997 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM997 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM997 are further described hereinbelow with reference to Table 1.

[13924] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM997 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13925] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 998 (VGAM998) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13926] VGAM998 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM998 was detected is described hereinabove with reference to Figs. 2–8.

[13927] VGAM998 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM998 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13928] VGAM998 gene, herein designated VGAM GENE, encodes a VGAM998 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM998 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM998 precursor RNA is designated SEQ ID:984, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:984 is located at position 64470 relative to the genome of Cowpox virus.

[13929] VGAM998 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13930] An enzyme complex designated DICER COMPLEX, dices the VGAM998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM998 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM998 RNA is designated SEQ ID:3709, and is provided hereinbelow with reference to the sequence listing part.

[13931] VGAM998 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13932] VGAM998 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM998 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM998 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13933] The complementary binding of VGAM998 RNA, herein designated VGAM RNA, to host target binding sites on VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM998 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM998 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13934] It is appreciated that VGAM998 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM998 host target genes. The mRNA of each one of this plurality of VGAM998 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM998 RNA, herein designated VGAM RNA, and which when bound by VGAM998 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM998 host target proteins.

[13935] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM998 gene, herein designated VGAM GENE, on one or more VGAM998 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13936] It is yet further appreciated that a function of VGAM998 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM998 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM998 correlate with, and may be deduced from, the identity of the host target genes which VGAM998 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13937] Nucleotide sequences of the VGAM998 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM998 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM998 are further described hereinbelow with reference to Table 1.

[13938] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM998 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13939] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 999 (VGAM999) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13940] VGAM999 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM999 was detected is described hereinabove with reference to Figs. 2–8.

[13941] VGAM999 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM999 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13942] VGAM999 gene, herein designated VGAM GENE, encodes a VGAM999 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM999 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM999 precursor RNA is designated SEQ ID:985, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:985 is located at position 62693 relative to the genome of Cowpox virus.

[13943] VGAM999 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13944] An enzyme complex designated DICER COMPLEX, dices the VGAM999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM999 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM999 RNA is designated SEQ ID:3710, and is provided hereinbelow with reference to the sequence listing part.

[13945] VGAM999 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13946] VGAM999 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM999 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM999 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13947] The complementary binding of VGAM999 RNA, herein designated VGAM RNA, to host target binding sites on VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM999 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM999 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13948] It is appreciated that VGAM999 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM999 host target genes. The mRNA of each one of this plurality of VGAM999 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM999 RNA, herein designated VGAM RNA, and which when bound by VGAM999 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM999 host target proteins.

[13949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM999 gene, herein designated VGAM GENE, on one or more VGAM999 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13950] It is yet further appreciated that a function of VGAM999 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM999 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM999 correlate with, and may be deduced from, the identity of the host target genes which VGAM999 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13951] Nucleotide sequences of the VGAM999 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM999 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM999 are further described hereinbelow with reference to Table 1.

[13952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM999 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13953] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1000 (VGAM1000) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13954] VGAM1000 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1000 was detected is described hereinabove with reference to Figs. 2–8.

[13955] VGAM1000 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM1000 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13956] VGAM1000 gene, herein designated VGAM GENE, encodes a VGAM1000 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1000 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1000 precursor RNA is designated SEQ ID:986, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:986 is located at position 63271 relative to the genome of Cowpox virus.

[13957] VGAM1000 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13958] An enzyme complex designated DICER COMPLEX, dices the VGAM1000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1000 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1000 RNA is designated SEQ ID:3711, and is provided hereinbelow with reference to the sequence listing part.

[13959] VGAM1000 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13960] VGAM1000 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1000 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1000 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13961] The complementary binding of VGAM1000 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1000 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1000 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13962] It is appreciated that VGAM1000 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1000 host target genes. The mRNA of each one of this plurality of VGAM1000 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1000 RNA, herein designated VGAM RNA, and which when bound by VGAM1000 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1000 host target proteins.

[13963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1000 gene, herein designated VGAM GENE, on one or more VGAM1000 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13964] It is yet further appreciated that a function of VGAM1000 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1000 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1000 correlate with, and may be deduced from, the identity of the host target genes which VGAM1000 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13965] Nucleotide sequences of the VGAM1000 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1000 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1000 are further described hereinbelow with reference to Table 1.

[13966] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1000 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13967] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1001 (VGAM1001) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13968] VGAM1001 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1001 was detected is described hereinabove with reference to Figs. 2-8.

[13969] VGAM1001 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13970] VGAM1001 gene, herein designated VGAM GENE, encodes a VGAM1001 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1001 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1001 precursor RNA is designated SEQ ID:987, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:987 is located at position 62554 relative to the genome of Cowpox virus.

[13971] VGAM1001 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13972] An enzyme complex designated DICER COMPLEX, dices the VGAM1001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1001 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1001 RNA is designated SEQ ID:3712, and is provided hereinbelow with reference to the sequence listing part.

[13973] VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13974] VGAM1001 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1001 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1001 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13975] The complementary binding of VGAM1001 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1001 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1001 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[13976] It is appreciated that VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1001 host target genes. The mRNA of each one of this plurality of VGAM1001 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1001 RNA, herein designated VGAM RNA, and which when bound by VGAM1001 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1001 host target proteins.

[13977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1001 gene, herein designated VGAM GENE, on one or more VGAM1001 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13978] It is yet further appreciated that a function of VGAM1001 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1001 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1001 correlate with, and may be deduced from, the identity of the host target genes which VGAM1001 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13979] Nucleotide sequences of the VGAM1001 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1001 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1001 are further described hereinbelow with reference to Table 1.

[13980] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1001 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13981] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1002 (VGAM1002) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13982] VGAM1002 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1002 was detected is described hereinabove with reference to Figs. 2-8.

[13983] VGAM1002 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13984] VGAM1002 gene, herein designated VGAM GENE, encodes a VGAM1002 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1002 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1002 precursor RNA is designated SEQ ID:988, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:988 is located at position 198161 relative to the genome of Chimpanzee cytomegalovirus.

[13985] VGAM1002 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13986] An enzyme complex designated DICER COMPLEX, dices the VGAM1002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1002 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1002 RNA is designated SEQ ID:3713, and is provided hereinbelow with reference to the sequence listing part.

[13987] VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[13988] VGAM1002 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1002 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1002 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[13989] The complementary binding of VGAM1002 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1002 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1002 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1002 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13990] It is appreciated that VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1002 host target genes. The mRNA of each one of this plurality of VGAM1002 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1002 RNA, herein designated VGAM RNA, and which when bound by VGAM1002 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1002 host target proteins.

[13991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1002 gene, herein designated VGAM GENE, on one or more VGAM1002 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[13992] It is yet further appreciated that a function of VGAM1002 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1002 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1002 correlate with, and may be deduced from, the identity of the host target genes which VGAM1002 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13993] Nucleotide sequences of the VGAM1002 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1002 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1002 are further

described hereinbelow with reference to Table 1.

[13994] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1002 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13995] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1003 (VGAM1003) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13996] VGAM1003 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1003 was detected is described hereinabove with reference to Figs. 2-8.

[13997] VGAM1003 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13998] VGAM1003 gene, herein designated VGAM GENE, encodes a VGAM1003 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1003 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1003 precursor RNA is designated SEQ ID:989, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:989 is located at position 199498 relative to the genome of Chimpanzee cytomegalovirus.

[13999] VGAM1003 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14000] An enzyme complex designated DICER COMPLEX, dices

the VGAM1003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1003 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1003 RNA is designated SEQ ID:3714, and is provided hereinbelow with reference to the sequence listing part.

[14001] VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14002] VGAM1003 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1003 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1003 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1003 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14003] The complementary binding of VGAM1003 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1003 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1003 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14004] It is appreciated that VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1003 host target genes. The mRNA of each one of this plurality of VGAM1003 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1003 RNA, herein designated VGAM RNA, and which when bound by VGAM1003 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1003 host target proteins.

[14005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1003 gene, herein designated VGAM GENE, on one or more VGAM1003 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14006] It is yet further appreciated that a function of VGAM1003 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1003 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1003 correlate with, and may be deduced from, the identity of the host target genes which VGAM1003 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14007] Nucleotide sequences of the VGAM1003 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1003 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1003 are further described hereinbelow with reference to Table 1.

[14008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1003 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14009] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1004 (VGAM1004) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14010] VGAM1004 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1004 was detected is described hereinabove with reference to Figs. 2-8.

[14011] VGAM1004 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1004 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14012] VGAM1004 gene, herein designated VGAM GENE, encodes a VGAM1004 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1004 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1004 precursor RNA is designated SEQ ID:990, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:990 is located at position 199410 relative to the genome of Chimpanzee cytomegalovirus.

[14013] VGAM1004 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[14014] An enzyme complex designated DICER COMPLEX, dices the VGAM1004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1004 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1004 RNA is designated SEQ ID:3715, and is provided hereinbelow with reference to the sequence listing part.

[14015] VGAM1004 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14016] VGAM1004 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1004 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1004 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14017] The complementary binding of VGAM1004 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1004 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1004 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14018] It is appreciated that VGAM1004 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1004 host target genes. The mRNA of each one of this plurality of VGAM1004 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1004 RNA, herein designated VGAM RNA, and which when bound by VGAM1004 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1004 host target proteins.

[14019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1004 gene, herein designated VGAM GENE, on one or more VGAM1004 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14020] It is yet further appreciated that a function of VGAM1004 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1004 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1004 correlate with, and may be deduced from, the identity of the host target genes which VGAM1004 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14021] Nucleotide sequences of the VGAM1004 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1004 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1004 are further described hereinbelow with reference to Table 1.

[14022] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1004 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14023] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1005 (VGAM1005) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14024] VGAM1005 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1005 was detected is described hereinabove with reference to Figs. 2-8.

[14025] VGAM1005 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14026] VGAM1005 gene, herein designated VGAM GENE, encodes a VGAM1005 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1005 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1005 precursor RNA is designated SEQ ID:991, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:991 is located at position 196285 relative to the genome of Chimpanzee cytomegalovirus.

[14027] VGAM1005 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14028] An enzyme complex designated DICER COMPLEX, dices the VGAM1005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1005 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1005 RNA is designated SEQ ID:3716, and is provided hereinbelow with reference to the sequence listing part.

[14029] VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[14030] VGAM1005 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1005 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1005 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14031] The complementary binding of VGAM1005 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1005 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1005 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14032] It is appreciated that VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1005 host target genes. The mRNA of each one of this plurality of VGAM1005 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1005 RNA, herein designated VGAM RNA, and which when bound by VGAM1005 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1005 host target proteins.

[14033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1005 gene, herein designated VGAM GENE, on one

or more VGAM1005 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14034] It is yet further appreciated that a function of VGAM1005 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1005 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1005 correlate with, and may be deduced from, the identity of the host target genes which VGAM1005 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14035] Nucleotide sequences of the VGAM1005 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1005 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1005 are further described hereinbelow with reference to Table 1.

[14036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1005 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14037] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1006 (VGAM1006) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14038] VGAM1006 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1006 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[14039] VGAM1006 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14040] VGAM1006 gene, herein designated VGAM GENE, encodes a VGAM1006 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1006 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1006 precursor RNA is designated SEQ ID:992, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:992 is located at position 197086 relative to the genome of Chimpanzee cytomegalovirus.

[14041] VGAM1006 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14042] An enzyme complex designated DICER COMPLEX, dices the VGAM1006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1006 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1006 RNA is designated SEQ ID:3717, and is provided hereinbelow with reference to the sequence listing part.

[14043] VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14044] VGAM1006 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1006 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1006 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14045] The complementary binding of VGAM1006 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1006 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1006 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14046] It is appreciated that VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1006 host target genes. The mRNA of each one of this plurality of VGAM1006 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1006 RNA, herein designated VGAM RNA, and which when bound by VGAM1006 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1006 host target proteins.

[14047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1006 gene, herein designated VGAM GENE, on one or more VGAM1006 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14048] It is yet further appreciated that a function of VGAM1006 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1006 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1006 correlate with, and may be deduced from, the identity of the host target genes which

VGAM1006 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14049] Nucleotide sequences of the VGAM1006 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1006 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1006 are further described hereinbelow with reference to Table 1.

[14050] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1006 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14051] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1007 (VGAM1007) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14052] VGAM1007 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1007 was detected is described hereinabove with reference to Figs. 2-8.

[14053] VGAM1007 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14054] VGAM1007 gene, herein designated VGAM GENE, encodes a VGAM1007 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1007 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1007 precursor RNA is designated SEQ ID:993, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:993 is located at position 200001 relative to the genome of Chimpanzee cytomegalovirus.

[14055] VGAM1007 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1007 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14056] An enzyme complex designated DICER COMPLEX, dices the VGAM1007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1007 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1007 RNA is designated SEQ ID:3718, and is provided hereinbelow with reference to the sequence listing part.

[14057] VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1007 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14058] VGAM1007 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1007 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1007 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14059] The complementary binding of VGAM1007 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1007 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1007 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14060] It is appreciated that VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1007 host target genes. The mRNA of each one of this plurality of VGAM1007 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1007 RNA, herein designated VGAM RNA, and which when bound by VGAM1007 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1007 host target proteins.

[14061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1007 gene, herein designated VGAM GENE, on one or more VGAM1007 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14062] It is yet further appreciated that a function of VGAM1007 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1007 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utili-

ties, of VGAM1007 correlate with, and may be deduced from, the identity of the host target genes which VGAM1007 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14063] Nucleotide sequences of the VGAM1007 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1007 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1007 are further described hereinbelow with reference to Table 1.

[14064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1007 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14065] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1008 (VGAM1008) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[14066] VGAM1008 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1008 was detected is described hereinabove with reference to Figs. 2–8.

[14067] VGAM1008 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14068] VGAM1008 gene, herein designated VGAM GENE, encodes a VGAM1008 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1008 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1008 precursor RNA is designated SEQ ID:994, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:994 is located at position 199188 relative to the genome of Chimpanzee cytomegalovirus.

[14069] VGAM1008 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14070] An enzyme complex designated DICER COMPLEX, dices the VGAM1008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1008 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1008 RNA is designated SEQ ID:3719, and is provided hereinbelow with reference to the sequence listing part.

[14071] VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14072] VGAM1008 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1008 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1008 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1008 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14073] The complementary binding of VGAM1008 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1008 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1008 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14074] It is appreciated that VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1008 host target genes. The mRNA of each one of this plurality of VGAM1008 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1008 RNA, herein designated VGAM RNA, and which when bound by VGAM1008 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1008 host target proteins.

[14075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1008 gene, herein designated VGAM GENE, on one or more VGAM1008 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14076] It is yet further appreciated that a function of VGAM1008 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1008 include diagnosis, prevention and

treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1008 correlate with, and may be deduced from, the identity of the host target genes which VGAM1008 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14077] Nucleotide sequences of the VGAM1008 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1008 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1008 are further described hereinbelow with reference to Table 1.

[14078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1008 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14079] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1009 (VGAM1009) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14080] VGAM1009 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1009 was detected is described hereinabove with reference to Figs. 2–8.

[14081] VGAM1009 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM1009 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14082] VGAM1009 gene, herein designated VGAM GENE, encodes a VGAM1009 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1009 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1009 precursor RNA is designated SEQ ID:995, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:995 is located at position 31121 relative to the genome of Equine herpesvirus 4.

[14083] VGAM1009 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14084] An enzyme complex designated DICER COMPLEX, dices the VGAM1009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1009 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1009 RNA is designated SEQ ID:3720, and is provided hereinbelow with reference to the sequence listing part.

[14085] VGAM1009 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14086] VGAM1009 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1009 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1009 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14087] The complementary binding of VGAM1009 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1009 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1009 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14088] It is appreciated that VGAM1009 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1009 host target genes. The mRNA of each one of this plurality of VGAM1009 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1009 RNA, herein designated VGAM

RNA, and which when bound by VGAM1009 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1009 host target proteins.

[14089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1009 gene, herein designated VGAM GENE, on one or more VGAM1009 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14090] It is yet further appreciated that a function of VGAM1009 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1009 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1009 correlate with, and may be deduced from, the identity of the host target genes which VGAM1009 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14091] Nucleotide sequences of the VGAM1009 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1009 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1009 are further described hereinbelow with reference to Table 1.

[14092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1009 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14093] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1010 (VGAM1010) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14094] VGAM1010 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1010 was detected is described hereinabove with reference to Figs. 2-8.

[14095] VGAM1010 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14096] VGAM1010 gene, herein designated VGAM GENE, encodes a VGAM1010 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1010 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1010 precursor RNA is designated SEQ ID:996, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:996 is located at position 29765

relative to the genome of Equine herpesvirus 4.

[14097] VGAM1010 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14098] An enzyme complex designated DICER COMPLEX, dices the VGAM1010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1010 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1010 RNA is designated SEQ ID:3721, and is provided hereinbelow with reference to the sequence listing part.

[14099] VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14100] VGAM1010 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1010 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1010 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14101] The complementary binding of VGAM1010 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1010 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1010 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14102] It is appreciated that VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1010 host target genes. The mRNA of each one of this plurality of VGAM1010 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1010 RNA, herein designated VGAM RNA, and which when bound by VGAM1010 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1010 host target proteins.

[14103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1010 gene, herein designated VGAM GENE, on one or more VGAM1010 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14104] It is yet further appreciated that a function of VGAM1010 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1010 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1010 correlate with, and may be deduced from, the identity of the host target genes which VGAM1010 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14105] Nucleotide sequences of the VGAM1010 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1010 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1010 are further described hereinbelow with reference to Table 1.

[14106] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1010 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14107] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1011 (VGAM1011) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14108] VGAM1011 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1011 was detected is described hereinabove with reference to Figs. 2–8.

[14109] VGAM1011 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14110] VGAM1011 gene, herein designated VGAM GENE, encodes a VGAM1011 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1011 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1011 precursor RNA is designated SEQ ID:997, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:997 is located at position 29460 relative to the genome of Equine herpesvirus 4.

[14111] VGAM1011 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14112] An enzyme complex designated DICER COMPLEX, dices the VGAM1011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1011 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1011 RNA is designated SEQ ID:3722, and is provided hereinbelow with reference to the sequence

listing part.

[14113] VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14114] VGAM1011 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1011 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1011 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14115] The complementary binding of VGAM1011 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1011 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1011 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14116] It is appreciated that VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1011 host target genes. The mRNA of each one of this plurality of VGAM1011 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1011 RNA, herein designated VGAM RNA, and which when bound by VGAM1011 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1011 host target proteins.

[14117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1011 gene, herein designated VGAM GENE, on one or more VGAM1011 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14118] It is yet further appreciated that a function of VGAM1011

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1011 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1011 correlate with, and may be deduced from, the identity of the host target genes which VGAM1011 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14119] Nucleotide sequences of the VGAM1011 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1011 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1011 are further described hereinbelow with reference to Table 1.

[14120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1011 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14121] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1012 (VGAM1012) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14122] VGAM1012 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1012 was detected is described hereinabove with reference to Figs. 2–8.

[14123] VGAM1012 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14124] VGAM1012 gene, herein designated VGAM GENE, encodes a VGAM1012 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1012 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1012 precursor RNA is designated SEQ ID:998, and is provided herein–

below with reference to the sequence listing part. Nucleotide sequence SEQ ID:998 is located at position 27830 relative to the genome of Equine herpesvirus 1.

[14125] VGAM1012 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14126] An enzyme complex designated DICER COMPLEX, dices the VGAM1012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1012 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1012 RNA is designated SEQ ID:3723, and

is provided hereinbelow with reference to the sequence listing part.

[14127] VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14128] VGAM1012 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1012 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1012 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14129] The complementary binding of VGAM1012 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1012 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1012 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14130] It is appreciated that VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1012 host target genes. The mRNA of each one of this plurality of VGAM1012 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1012 RNA, herein designated VGAM RNA, and which when bound by VGAM1012 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1012 host target proteins.

[14131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1012 gene, herein designated VGAM GENE, on one or more VGAM1012 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14132] It is yet further appreciated that a function of VGAM1012 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1012 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1012 correlate with, and may be deduced from, the identity of the host target genes which VGAM1012 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14133] Nucleotide sequences of the VGAM1012 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1012 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1012 are further described hereinbelow with reference to Table 1.

[14134] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1012 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14135] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1013 (VGAM1013) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14136] VGAM1013 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1013 was detected is described hereinabove with reference to Figs. 2–8.

[14137] VGAM1013 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14138] VGAM1013 gene, herein designated VGAM GENE, encodes a VGAM1013 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1013 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1013 precu-

sor RNA is designated SEQ ID:999, and is provided herein—below with reference to the sequence listing part. Nucleotide sequence SEQ ID:999 is located at position 32583 relative to the genome of Equine herpesvirus 1.

[14139] VGAM1013 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14140] An enzyme complex designated DICER COMPLEX, dices the VGAM1013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1013 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide se—

quence of VGAM1013 RNA is designated SEQ ID:3724, and is provided hereinbelow with reference to the sequence listing part.

[14141] VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14142] VGAM1013 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1013 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1013 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14143] The complementary binding of VGAM1013 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1013 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1013 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14144] It is appreciated that VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1013 host target genes. The mRNA of

each one of this plurality of VGAM1013 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1013 RNA, herein designated VGAM RNA, and which when bound by VGAM1013 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1013 host target proteins.

[14145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1013 gene, herein designated VGAM GENE, on one or more VGAM1013 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[14146] It is yet further appreciated that a function of VGAM1013 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1013 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1013 correlate with, and may be deduced from, the identity of the host target genes which VGAM1013 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14147] Nucleotide sequences of the VGAM1013 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1013 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1013 are further described hereinbelow with reference to Table 1.

[14148] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1013 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[14149] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1014 (VGAM1014) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14150] VGAM1014 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1014 was detected is described hereinabove with reference to Figs. 2–8.

[14151] VGAM1014 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14152] VGAM1014 gene, herein designated VGAM GENE, encodes a VGAM1014 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1014 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1014 precursor RNA is designated SEQ ID:1000, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1000 is located at position 82653 relative to the genome of *Rana tigrina* ranavirus.

[14153] VGAM1014 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14154] An enzyme complex designated DICER COMPLEX, dices the VGAM1014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1014 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1014 RNA is designated SEQ ID:3725, and is provided hereinbelow with reference to the sequence listing part.

[14155] VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14156] VGAM1014 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1014 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1014 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14157] The complementary binding of VGAM1014 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1014 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1014 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14158] It is appreciated that VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1014 host target genes. The mRNA of each one of this plurality of VGAM1014 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1014 RNA, herein designated VGAM RNA, and which when bound by VGAM1014 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1014 host target proteins.

[14159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1014 gene, herein designated VGAM GENE, on one or more VGAM1014 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[14160] It is yet further appreciated that a function of VGAM1014 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1014 include diagnosis, prevention and treatment of viral infection by *Rana tigrina* ranavirus. Specific functions, and accordingly utilities, of VGAM1014 correlate with, and may be deduced from, the identity of the host target genes which VGAM1014 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14161] Nucleotide sequences of the VGAM1014 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1014 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1014 are further described hereinbelow with reference to Table 1.

[14162] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1014 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14163] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1015 (VGAM1015) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14164] VGAM1015 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1015 was detected is described hereinabove with reference to Figs. 2-8.

[14165] VGAM1015 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Broad bean necrosis virus. VGAM1015 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14166] VGAM1015 gene, herein designated VGAM GENE, encodes a VGAM1015 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1015 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1015 precursor RNA is designated SEQ ID:1001, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1001 is located at position 1200 relative to the genome of Broad bean necrosis virus.

[14167] VGAM1015 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14168] An enzyme complex designated DICER COMPLEX, dices the VGAM1015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1015 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1015 RNA is designated SEQ ID:3726, and is provided hereinbelow with reference to the sequence listing part.

[14169] VGAM1015 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14170] VGAM1015 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1015 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1015 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14171] The complementary binding of VGAM1015 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1015 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1015 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14172] It is appreciated that VGAM1015 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1015 host target genes. The mRNA of each one of this plurality of VGAM1015 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1015 RNA, herein designated VGAM RNA, and which when bound by VGAM1015 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1015 host target proteins.

[14173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1015 gene, herein designated VGAM GENE, on one or more VGAM1015 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14174] It is yet further appreciated that a function of VGAM1015 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1015 include diagnosis, prevention and treatment of viral infection by Broad bean necrosis virus. Specific functions, and accordingly utilities, of VGAM1015 correlate with, and may be deduced from, the identity of the host target genes which VGAM1015 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14175] Nucleotide sequences of the VGAM1015 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1015 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1015 are further described hereinbelow with reference to Table 1.

[14176] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1015 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14177] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1016 (VGAM1016) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14178] VGAM1016 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1016 was detected is described hereinabove with reference to Figs. 2–8.

[14179] VGAM1016 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Broad bean necrosis virus. VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14180] VGAM1016 gene, herein designated VGAM GENE, encodes a VGAM1016 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1016 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1016 precursor RNA is designated SEQ ID:1002, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1002 is located at position 4420 relative to the genome of Broad bean necrosis virus.

[14181] VGAM1016 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14182] An enzyme complex designated DICER COMPLEX, dices the VGAM1016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1016 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1016 RNA is designated SEQ ID:3727, and is provided hereinbelow with reference to the sequence listing part.

[14183] VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14184] VGAM1016 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1016 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1016 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14185] The complementary binding of VGAM1016 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1016 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1016 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14186] It is appreciated that VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1016 host target genes. The mRNA of each one of this plurality of VGAM1016 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1016 RNA, herein designated VGAM RNA, and which when bound by VGAM1016 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1016 host target proteins.

[14187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1016 gene, herein designated VGAM GENE, on one or more VGAM1016 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14188] It is yet further appreciated that a function of VGAM1016 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1016 include diagnosis, prevention and treatment of viral infection by Broad bean necrosis virus. Specific functions, and accordingly utilities, of VGAM1016 correlate with, and may be deduced from, the identity of the host target genes which VGAM1016 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14189] Nucleotide sequences of the VGAM1016 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1016 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1016 are further described hereinbelow with reference to Table 1.

[14190] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1016 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14191] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1017 (VGAM1017) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14192] VGAM1017 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1017 was detected is described hereinabove with reference to Figs. 2-8.

[14193] VGAM1017 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet western yellows virus. VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14194] VGAM1017 gene, herein designated VGAM GENE, encodes a VGAM1017 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1017 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1017 precursor RNA is designated SEQ ID:1003, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1003 is located at position 4604 relative to the genome of Beet western yellows virus.

[14195] VGAM1017 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14196] An enzyme complex designated DICER COMPLEX, dices the VGAM1017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1017 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1017 RNA is designated SEQ ID:3728, and is provided hereinbelow with reference to the sequence listing part.

[14197] VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14198] VGAM1017 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1017 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1017 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14199] The complementary binding of VGAM1017 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1017 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1017 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[14200] It is appreciated that VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1017 host target genes. The mRNA of each one of this plurality of VGAM1017 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1017 RNA, herein designated VGAM RNA, and which when bound by VGAM1017 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1017 host target proteins.

[14201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1017 gene, herein designated VGAM GENE, on one or more VGAM1017 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14202] It is yet further appreciated that a function of VGAM1017 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1017 include diagnosis, prevention and treatment of viral infection by Beet western yellows virus. Specific functions, and accordingly utilities, of VGAM1017 correlate with, and may be deduced from, the identity of the host target genes which VGAM1017 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14203] Nucleotide sequences of the VGAM1017 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1017 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1017 are further described hereinbelow with reference to Table 1.

[14204] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1017 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14205] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1018 (VGAM1018) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14206] VGAM1018 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1018 was detected is described hereinabove with reference to Figs. 2-8.

[14207] VGAM1018 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet western yellows virus. VGAM1018 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14208] VGAM1018 gene, herein designated VGAM GENE, encodes a VGAM1018 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1018 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1018 precursor RNA is designated SEQ ID:1004, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1004 is located at position 3512 relative to the genome of Beet western yellows virus.

[14209] VGAM1018 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14210] An enzyme complex designated DICER COMPLEX, dices the VGAM1018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1018 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1018 RNA is designated SEQ ID:3729, and is provided hereinbelow with reference to the sequence listing part.

[14211] VGAM1018 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14212] VGAM1018 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1018 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1018 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14213] The complementary binding of VGAM1018 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1018 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1018 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14214] It is appreciated that VGAM1018 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1018 host target genes. The mRNA of each one of this plurality of VGAM1018 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1018 RNA, herein designated VGAM RNA, and which when bound by VGAM1018 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1018 host target proteins.

[14215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1018 gene, herein designated VGAM GENE, on one or more VGAM1018 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14216] It is yet further appreciated that a function of VGAM1018 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1018 include diagnosis, prevention and treatment of viral infection by Beet western yellows virus. Specific functions, and accordingly utilities, of VGAM1018 correlate with, and may be deduced from, the identity of the host target genes which VGAM1018 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14217] Nucleotide sequences of the VGAM1018 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1018 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1018 are further described hereinbelow with reference to Table 1.

[14218] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1018 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14219] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1019 (VGAM1019) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14220] VGAM1019 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1019 was detected is described hereinabove with reference to Figs. 2-8.

[14221] VGAM1019 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet western yellows virus. VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14222] VGAM1019 gene, herein designated VGAM GENE, encodes

a VGAM1019 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1019 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1019 precursor RNA is designated SEQ ID:1005, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1005 is located at position 5178 relative to the genome of Beet western yellows virus.

[14223] VGAM1019 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14224] An enzyme complex designated DICER COMPLEX, dices the VGAM1019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1019 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1019 RNA is designated SEQ ID:3730, and is provided hereinbelow with reference to the sequence listing part.

[14225] VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14226] VGAM1019 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1019 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1019 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14227] The complementary binding of VGAM1019 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1019 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1019 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1019 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14228] It is appreciated that VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1019 host target genes. The mRNA of each one of this plurality of VGAM1019 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1019 RNA, herein designated VGAM RNA, and which when bound by VGAM1019 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1019 host target proteins.

[14229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1019 gene, herein designated VGAM GENE, on one or more VGAM1019 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14230] It is yet further appreciated that a function of VGAM1019 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1019 include diagnosis, prevention and treatment of viral infection by Beet western yellows virus. Specific functions, and accordingly utilities, of VGAM1019 correlate with, and may be deduced from, the identity of the host target genes which VGAM1019 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14231] Nucleotide sequences of the VGAM1019 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1019 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1019 are further

described hereinbelow with reference to Table 1.

[14232] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1019 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14233] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1020 (VGAM1020) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14234] VGAM1020 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1020 was detected is described hereinabove with reference to Figs. 2-8.

[14235] VGAM1020 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal yellow dwarf virus – RPV. VGAM1020 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14236] VGAM1020 gene, herein designated VGAM GENE, encodes a VGAM1020 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1020 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1020 precursor RNA is designated SEQ ID:1006, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1006 is located at position 3793 relative to the genome of Cereal yellow dwarf virus – RPV.

[14237] VGAM1020 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14238] An enzyme complex designated DICER COMPLEX, dices the VGAM1020 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1020 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1020 RNA is designated SEQ ID:3731, and is provided hereinbelow with reference to the sequence listing part.

[14239] VGAM1020 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14240] VGAM1020 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1020 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1020 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14241] The complementary binding of VGAM1020 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1020 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1020

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1020 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14242] It is appreciated that VGAM1020 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1020 host target genes. The mRNA of each one of this plurality of VGAM1020 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1020 RNA, herein designated VGAM RNA, and which when bound by VGAM1020 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1020 host target proteins.

[14243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1020 gene, herein designated VGAM GENE, on one or more VGAM1020 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14244] It is yet further appreciated that a function of VGAM1020 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1020 include diagnosis, prevention and treatment of viral infection by Cereal yellow dwarf virus – RPV. Specific functions, and accordingly utilities, of VGAM1020 correlate with, and may be deduced from, the identity of the host target genes which VGAM1020 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14245] Nucleotide sequences of the VGAM1020 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1020 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1020 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1020 are further described hereinbelow with reference to Table 1.

[14246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1020 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14247] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1021 (VGAM1021) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14248] VGAM1021 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1021 was detected is described hereinabove with reference to Figs. 2-8.

[14249] VGAM1021 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal yellow dwarf virus – RPV. VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[14250] VGAM1021 gene, herein designated VGAM GENE, encodes a VGAM1021 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1021 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1021 precursor RNA is designated SEQ ID:1007, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1007 is located at position 2132 relative to the genome of Cereal yellow dwarf virus – RPV.

[14251] VGAM1021 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14252] An enzyme complex designated DICER COMPLEX, dices

the VGAM1021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1021 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1021 RNA is designated SEQ ID:3732, and is provided hereinbelow with reference to the sequence listing part.

[14253] VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14254] VGAM1021 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1021 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1021 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1021 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14255] The complementary binding of VGAM1021 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1021 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1021 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14256] It is appreciated that VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1021 host target genes. The mRNA of each one of this plurality of VGAM1021 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1021 RNA, herein designated VGAM RNA, and which when bound by VGAM1021 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1021 host target proteins.

[14257] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1021 gene, herein designated VGAM GENE, on one or more VGAM1021 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14258] It is yet further appreciated that a function of VGAM1021 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1021 include diagnosis, prevention and treatment of viral infection by Cereal yellow dwarf virus – RPV. Specific functions, and accordingly utilities, of VGAM1021 correlate with, and may be deduced from, the identity of the host target genes which VGAM1021 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14259] Nucleotide sequences of the VGAM1021 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1021 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1021 are further described hereinbelow with reference to Table 1.

[14260] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1021 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14261] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1022 (VGAM1022) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14262] VGAM1022 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1022 was detected is described hereinabove with reference to Figs. 2-8.

[14263] VGAM1022 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal yellow dwarf virus – RPV. VGAM1022 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14264] VGAM1022 gene, herein designated VGAM GENE, encodes a VGAM1022 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1022 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1022 precursor RNA is designated SEQ ID:1008, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1008 is located at position 2327 relative to the genome of Cereal yellow dwarf virus – RPV.

[14265] VGAM1022 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14266] An enzyme complex designated DICER COMPLEX, dices the VGAM1022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1022 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1022 RNA is designated SEQ ID:3733, and is provided hereinbelow with reference to the sequence listing part.

[14267] VGAM1022 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14268] VGAM1022 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1022 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1022 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14269] The complementary binding of VGAM1022 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1022 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1022 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1022 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14270] It is appreciated that VGAM1022 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1022 host target genes. The mRNA of each one of this plurality of VGAM1022 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1022 RNA, herein designated VGAM RNA, and which when bound by VGAM1022 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1022 host target proteins.

[14271] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1022 gene, herein designated VGAM GENE, on one or more VGAM1022 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14272] It is yet further appreciated that a function of VGAM1022 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1022 include diagnosis, prevention and treatment of viral infection by Cereal yellow dwarf virus – RPV. Specific functions, and accordingly utilities, of VGAM1022 correlate with, and may be deduced from, the identity of the host target genes which VGAM1022 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14273] Nucleotide sequences of the VGAM1022 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1022 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1022 are further described hereinbelow with reference to Table 1.

[14274] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1022 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14275] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1023 (VGAM1023) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14276] VGAM1023 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1023 was detected is described hereinabove with reference to Figs. 2-8.

[14277] VGAM1023 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal yellow dwarf virus

– RPV. VGAM1023 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14278] VGAM1023 gene, herein designated VGAM GENE, encodes a VGAM1023 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1023 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1023 precursor RNA is designated SEQ ID:1009, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1009 is located at position 3936 relative to the genome of Cereal yellow dwarf virus – RPV.

[14279] VGAM1023 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[14280] An enzyme complex designated DICER COMPLEX, dices the VGAM1023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1023 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1023 RNA is designated SEQ ID:3734, and is provided hereinbelow with reference to the sequence listing part.

[14281] VGAM1023 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14282] VGAM1023 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1023 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1023 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14283] The complementary binding of VGAM1023 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1023 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1023 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14284] It is appreciated that VGAM1023 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1023 host target genes. The mRNA of each one of this plurality of VGAM1023 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1023 RNA, herein designated VGAM RNA, and which when bound by VGAM1023 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1023 host target proteins.

[14285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1023 gene, herein designated VGAM GENE, on one or more VGAM1023 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14286] It is yet further appreciated that a function of VGAM1023 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1023 include diagnosis, prevention and treatment of viral infection by Cereal yellow dwarf virus – RPV. Specific functions, and accordingly utilities, of

VGAM1023 correlate with, and may be deduced from, the identity of the host target genes which VGAM1023 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14287] Nucleotide sequences of the VGAM1023 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1023 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1023 are further described hereinbelow with reference to Table 1.

[14288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1023 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14289] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1024 (VGAM1024) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[14290] VGAM1024 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1024 was detected is described hereinabove with reference to Figs. 2–8.

[14291] VGAM1024 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal yellow dwarf virus – RPV. VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14292] VGAM1024 gene, herein designated VGAM GENE, encodes a VGAM1024 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1024 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1024 precursor RNA is designated SEQ ID:1010, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1010 is located at position 672 relative to the genome of Cereal yellow dwarf virus – RPV.

[14293] VGAM1024 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1024 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14294] An enzyme complex designated DICER COMPLEX, dices the VGAM1024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1024 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1024 RNA is designated SEQ ID:3735, and is provided hereinbelow with reference to the sequence listing part.

[14295] VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1024 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14296] VGAM1024 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1024 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1024 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14297] The complementary binding of VGAM1024 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1024 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1024 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14298] It is appreciated that VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1024 host target genes. The mRNA of each one of this plurality of VGAM1024 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1024 RNA, herein designated VGAM RNA, and which when bound by VGAM1024 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1024 host target proteins.

[14299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1024 gene, herein designated VGAM GENE, on one or more VGAM1024 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14300] It is yet further appreciated that a function of VGAM1024 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1024 include diagnosis, prevention and treatment of viral infection by Cereal yellow dwarf virus –

RPV. Specific functions, and accordingly utilities, of VGAM1024 correlate with, and may be deduced from, the identity of the host target genes which VGAM1024 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14301] Nucleotide sequences of the VGAM1024 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1024 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1024 are further described hereinbelow with reference to Table 1.

[14302] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1024 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14303] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1025 (VGAM1025) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[14304] VGAM1025 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1025 was detected is described hereinabove with reference to Figs. 2–8.

[14305] VGAM1025 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal yellow dwarf virus – RPV. VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14306] VGAM1025 gene, herein designated VGAM GENE, encodes a VGAM1025 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1025 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1025 precursor RNA is designated SEQ ID:1011, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1011 is located at position 3393 relative to the genome of Cereal yellow dwarf virus – RPV.

[14307] VGAM1025 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14308] An enzyme complex designated DICER COMPLEX, dices the VGAM1025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1025 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1025 RNA is designated SEQ ID:3736, and is provided hereinbelow with reference to the sequence listing part.

[14309] VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14310] VGAM1025 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1025 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1025 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1025 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14311] The complementary binding of VGAM1025 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1025 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1025 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14312] It is appreciated that VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1025 host target genes. The mRNA of each one of this plurality of VGAM1025 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1025 RNA, herein designated VGAM RNA, and which when bound by VGAM1025 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1025 host target proteins.

[14313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1025 gene, herein designated VGAM GENE, on one or more VGAM1025 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14314] It is yet further appreciated that a function of VGAM1025 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1025 include diagnosis, prevention and

treatment of viral infection by Cereal yellow dwarf virus – RPV. Specific functions, and accordingly utilities, of VGAM1025 correlate with, and may be deduced from, the identity of the host target genes which VGAM1025 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14315] Nucleotide sequences of the VGAM1025 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1025 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1025 are further described hereinbelow with reference to Table 1.

[14316] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1025 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14317] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1026 (VGAM1026) viral gene, which modulates ex–

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14318] VGAM1026 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1026 was detected is described hereinabove with reference to Figs. 2–8.

[14319] VGAM1026 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cereal yellow dwarf virus – RPV. VGAM1026 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14320] VGAM1026 gene, herein designated VGAM GENE, encodes a VGAM1026 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1026 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1026 precursor RNA is designated SEQ ID:1012, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1012 is located at position 1766 relative to the genome of Cereal yellow dwarf virus – RPV.

[14321] VGAM1026 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14322] An enzyme complex designated DICER COMPLEX, dices the VGAM1026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1026 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1026 RNA is designated SEQ ID:3737, and is provided hereinbelow with reference to the sequence listing part.

[14323] VGAM1026 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14324] VGAM1026 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1026 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1026 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14325] The complementary binding of VGAM1026 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1026 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1026 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14326] It is appreciated that VGAM1026 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1026 host target genes. The mRNA of each one of this plurality of VGAM1026 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1026 RNA, herein designated VGAM

RNA, and which when bound by VGAM1026 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1026 host target proteins.

[14327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1026 gene, herein designated VGAM GENE, on one or more VGAM1026 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14328] It is yet further appreciated that a function of VGAM1026 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1026 include diagnosis, prevention and treatment of viral infection by Cereal yellow dwarf virus – RPV. Specific functions, and accordingly utilities, of VGAM1026 correlate with, and may be deduced from, the identity of the host target genes which VGAM1026 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14329] Nucleotide sequences of the VGAM1026 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1026 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1026 are further described hereinbelow with reference to Table 1.

[14330] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1026 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14331] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes–

senger 1027 (VGAM1027) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14332] VGAM1027 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1027 was detected is described hereinabove with reference to Figs. 2-8.

[14333] VGAM1027 gene, herein designated VGAM GENE, is a viral gene contained in the genome of ictalurid herpesvirus 1. VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14334] VGAM1027 gene, herein designated VGAM GENE, encodes a VGAM1027 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1027 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1027 precursor RNA is designated SEQ ID:1013, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1013 is located at position

89420 relative to the genome of ictalurid herpesvirus 1.

[14335] VGAM1027 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14336] An enzyme complex designated DICER COMPLEX, dices the VGAM1027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1027 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1027 RNA is designated SEQ ID:3738, and is provided hereinbelow with reference to the sequence listing part.

[14337] VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14338] VGAM1027 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1027 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1027 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14339] The complementary binding of VGAM1027 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1027 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1027 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14340] It is appreciated that VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1027 host target genes. The mRNA of each one of this plurality of VGAM1027 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1027 RNA, herein designated VGAM RNA, and which when bound by VGAM1027 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1027 host target proteins.

[14341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1027 gene, herein designated VGAM GENE, on one or more VGAM1027 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14342] It is yet further appreciated that a function of VGAM1027 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1027 include diagnosis, prevention and treatment of viral infection by ictalurid herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM1027 correlate with, and may be deduced from, the identity of the host target genes which VGAM1027 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14343] Nucleotide sequences of the VGAM1027 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1027 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1027 are further described hereinbelow with reference to Table 1.

[14344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1027 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14345] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1028 (VGAM1028) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14346] VGAM1028 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1028 was detected is described hereinabove with reference to Figs. 2–8.

[14347] VGAM1028 gene, herein designated VGAM GENE, is a viral gene contained in the genome of ictalurid herpesvirus 1. VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14348] VGAM1028 gene, herein designated VGAM GENE, encodes a VGAM1028 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1028 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1028 precursor RNA is designated SEQ ID:1014, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1014 is located at position 86483 relative to the genome of ictalurid herpesvirus 1.

[14349] VGAM1028 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14350] An enzyme complex designated DICER COMPLEX, dices the VGAM1028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1028 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1028 RNA is designated SEQ ID:3739, and is provided hereinbelow with reference to the sequence

listing part.

[14351] VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14352] VGAM1028 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1028 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1028 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14353] The complementary binding of VGAM1028 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1028 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1028 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14354] It is appreciated that VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1028 host target genes. The mRNA of each one of this plurality of VGAM1028 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1028 RNA, herein designated VGAM RNA, and which when bound by VGAM1028 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1028 host target proteins.

[14355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1028 gene, herein designated VGAM GENE, on one or more VGAM1028 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14356] It is yet further appreciated that a function of VGAM1028

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1028 include diagnosis, prevention and treatment of viral infection by ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1028 correlate with, and may be deduced from, the identity of the host target genes which VGAM1028 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14357] Nucleotide sequences of the VGAM1028 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1028 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1028 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1028 are further described hereinbelow with reference to Table 1.

[14358] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1028 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14359] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1029 (VGAM1029) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14360] VGAM1029 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1029 was detected is described hereinabove with reference to Figs. 2–8.

[14361] VGAM1029 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow dwarf virus – PAV. VGAM1029 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14362] VGAM1029 gene, herein designated VGAM GENE, encodes a VGAM1029 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1029 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1029 precursor RNA is designated SEQ ID:1015, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1015 is located at position 1469 relative to the genome of Barley yellow dwarf virus – PAV.

[14363] VGAM1029 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14364] An enzyme complex designated DICER COMPLEX, dices the VGAM1029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1029 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1029 RNA is designated SEQ ID:3740, and

is provided hereinbelow with reference to the sequence listing part.

[14365] VGAM1029 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14366] VGAM1029 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1029 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1029 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14367] The complementary binding of VGAM1029 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1029 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1029 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14368] It is appreciated that VGAM1029 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1029 host target genes. The mRNA of each one of this plurality of VGAM1029 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1029 RNA, herein designated VGAM RNA, and which when bound by VGAM1029 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1029 host target proteins.

[14369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1029 gene, herein designated VGAM GENE, on one or more VGAM1029 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14370] It is yet further appreciated that a function of VGAM1029 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1029 include diagnosis, prevention and treatment of viral infection by Barley yellow dwarf virus – PAV. Specific functions, and accordingly utilities, of VGAM1029 correlate with, and may be deduced from, the identity of the host target genes which VGAM1029 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14371] Nucleotide sequences of the VGAM1029 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1029 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1029 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1029 are further described hereinbelow with reference to Table 1.

[14372] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1029 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14373] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1030 (VGAM1030) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14374] VGAM1030 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1030 was detected is described hereinabove with reference to Figs. 2–8.

[14375] VGAM1030 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet mild yellowing virus. VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14376] VGAM1030 gene, herein designated VGAM GENE, encodes a VGAM1030 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1030 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1030 precu-

sor RNA is designated SEQ ID:1016, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1016 is located at position 3757 relative to the genome of Beet mild yellowing virus.

[14377] VGAM1030 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14378] An enzyme complex designated DICER COMPLEX, dices the VGAM1030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1030 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1030 RNA is designated SEQ ID:3741, and is provided hereinbelow with reference to the sequence listing part.

[14379] VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14380] VGAM1030 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1030 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1030 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14381] The complementary binding of VGAM1030 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1030 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1030 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14382] It is appreciated that VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1030 host target genes. The mRNA of

each one of this plurality of VGAM1030 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1030 RNA, herein designated VGAM RNA, and which when bound by VGAM1030 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1030 host target proteins.

[14383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1030 gene, herein designated VGAM GENE, on one or more VGAM1030 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[14384] It is yet further appreciated that a function of VGAM1030 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1030 include diagnosis, prevention and treatment of viral infection by Beet mild yellowing virus. Specific functions, and accordingly utilities, of VGAM1030 correlate with, and may be deduced from, the identity of the host target genes which VGAM1030 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14385] Nucleotide sequences of the VGAM1030 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1030 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1030 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1030 are further described hereinbelow with reference to Table 1.

[14386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1030 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[14387] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1031 (VGAM1031) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14388] VGAM1031 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1031 was detected is described hereinabove with reference to Figs. 2–8.

[14389] VGAM1031 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet mild yellowing virus. VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14390] VGAM1031 gene, herein designated VGAM GENE, encodes a VGAM1031 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1031 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1031 precursor RNA is designated SEQ ID:1017, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1017 is located at position 2997 relative to the genome of Beet mild yellowing virus.

[14391] VGAM1031 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14392] An enzyme complex designated DICER COMPLEX, dices the VGAM1031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1031 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1031 RNA is designated SEQ ID:3742, and is provided hereinbelow with reference to the sequence listing part.

[14393] VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14394] VGAM1031 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1031 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1031 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14395] The complementary binding of VGAM1031 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1031 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1031 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14396] It is appreciated that VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1031 host target genes. The mRNA of each one of this plurality of VGAM1031 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1031 RNA, herein designated VGAM RNA, and which when bound by VGAM1031 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1031 host target proteins.

[14397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1031 gene, herein designated VGAM GENE, on one or more VGAM1031 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [14398] It is yet further appreciated that a function of VGAM1031 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1031 include diagnosis, prevention and treatment of viral infection by Beet mild yellowing virus. Specific functions, and accordingly utilities, of VGAM1031 correlate with, and may be deduced from, the identity of the host target genes which VGAM1031 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [14399] Nucleotide sequences of the VGAM1031 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1031 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1031 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1031 are further described hereinbelow with reference to Table 1.
- [14400] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1031 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14401] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1032 (VGAM1032) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14402] VGAM1032 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1032 was detected is described hereinabove with reference to Figs. 2-8.

[14403] VGAM1032 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1032 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14404] VGAM1032 gene, herein designated VGAM GENE, encodes a VGAM1032 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1032 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1032 precursor RNA is designated SEQ ID:1018, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1018 is located at position 107348 relative to the genome of Cercopithecine herpesvirus 7.

[14405] VGAM1032 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14406] An enzyme complex designated DICER COMPLEX, dices the VGAM1032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1032 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1032 RNA is designated SEQ ID:3743, and is provided hereinbelow with reference to the sequence listing part.

[14407] VGAM1032 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1032 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1032 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14408] VGAM1032 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1032 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1032 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1032 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1032 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14409] The complementary binding of VGAM1032 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1032 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1032 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1032 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14410] It is appreciated that VGAM1032 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1032 host target genes. The mRNA of each one of this plurality of VGAM1032 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1032 RNA, herein designated VGAM RNA, and which when bound by VGAM1032 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1032 host target proteins.

[14411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1032 gene, herein designated VGAM GENE, on one or more VGAM1032 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14412] It is yet further appreciated that a function of VGAM1032 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1032 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1032 correlate with, and may be deduced from, the identity of the host target genes which VGAM1032 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14413] Nucleotide sequences of the VGAM1032 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1032 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1032 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1032 are further described hereinbelow with reference to Table 1.

[14414] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1032 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14415] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1033 (VGAM1033) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14416] VGAM1033 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1033 was detected is described hereinabove with reference to Figs. 2-8.

[14417] VGAM1033 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14418] VGAM1033 gene, herein designated VGAM GENE, encodes a VGAM1033 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1033 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1033 precursor RNA is designated SEQ ID:1019, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1019 is located at position 105205 relative to the genome of Cercopithecine herpesvirus 7.

[14419] VGAM1033 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14420] An enzyme complex designated DICER COMPLEX, dices the VGAM1033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1033 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1033 RNA is designated SEQ ID:3744, and is provided hereinbelow with reference to the sequence listing part.

[14421] VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14422] VGAM1033 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1033 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1033 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14423] The complementary binding of VGAM1033 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1033 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1033 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14424] It is appreciated that VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1033 host target genes. The mRNA of each one of this plurality of VGAM1033 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1033 RNA, herein designated VGAM RNA, and which when bound by VGAM1033 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1033 host target proteins.

[14425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1033 gene, herein designated VGAM GENE, on one or more VGAM1033 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14426] It is yet further appreciated that a function of VGAM1033 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1033 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1033 correlate with, and may be deduced from, the identity of the host target genes which VGAM1033 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14427] Nucleotide sequences of the VGAM1033 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1033 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1033 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1033 are further described hereinbelow with reference to Table 1.

[14428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1033 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14429] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1034 (VGAM1034) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14430] VGAM1034 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1034 was detected is described hereinabove with reference to Figs. 2-8.

[14431] VGAM1034 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14432] VGAM1034 gene, herein designated VGAM GENE, encodes

a VGAM1034 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1034 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1034 precursor RNA is designated SEQ ID:1020, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1020 is located at position 108515 relative to the genome of Cercopithecine herpesvirus 7.

[14433] VGAM1034 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1034 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14434] An enzyme complex designated DICER COMPLEX, dices the VGAM1034 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1034 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1034 RNA is designated SEQ ID:3745, and is provided hereinbelow with reference to the sequence listing part.

[14435] VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14436] VGAM1034 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1034 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1034 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14437] The complementary binding of VGAM1034 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1034 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1034

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1034 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14438] It is appreciated that VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1034 host target genes. The mRNA of each one of this plurality of VGAM1034 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1034 RNA, herein designated VGAM RNA, and which when bound by VGAM1034 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1034 host target proteins.

[14439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1034 gene, herein designated VGAM GENE, on one or more VGAM1034 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14440] It is yet further appreciated that a function of VGAM1034 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1034 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1034 correlate with, and may be deduced from, the identity of the host target genes which VGAM1034 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14441] Nucleotide sequences of the VGAM1034 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1034 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1034 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1034 are further described hereinbelow with reference to Table 1.

[14442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1034 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14443] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1035 (VGAM1035) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14444] VGAM1035 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1035 was detected is described hereinabove with reference to Figs. 2-8.

[14445] VGAM1035 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[14446] VGAM1035 gene, herein designated VGAM GENE, encodes a VGAM1035 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1035 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1035 precursor RNA is designated SEQ ID:1021, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1021 is located at position 105937 relative to the genome of Cercopithecine herpesvirus 7.

[14447] VGAM1035 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14448] An enzyme complex designated DICER COMPLEX, dices the VGAM1035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1035 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1035 RNA is designated SEQ ID:3746, and is provided hereinbelow with reference to the sequence listing part.

[14449] VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14450] VGAM1035 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1035 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1035 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14451] The complementary binding of VGAM1035 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1035 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1035 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1035 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14452] It is appreciated that VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1035 host target genes. The mRNA of each one of this plurality of VGAM1035 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1035 RNA, herein designated VGAM RNA, and which when bound by VGAM1035 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1035 host target proteins.

[14453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1035 gene, herein designated VGAM GENE, on one or more VGAM1035 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14454] It is yet further appreciated that a function of VGAM1035 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1035 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1035 correlate with, and may be deduced from, the identity of the host target genes which VGAM1035 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14455] Nucleotide sequences of the VGAM1035 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1035 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1035 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1035 are further described hereinbelow with reference to Table 1.

[14456] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1035 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14457] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1036 (VGAM1036) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14458] VGAM1036 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1036 was detected is described hereinabove with reference to Figs. 2-8.

[14459] VGAM1036 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine her-

pesvirus 7. VGAM1036 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14460] VGAM1036 gene, herein designated VGAM GENE, encodes a VGAM1036 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1036 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1036 precursor RNA is designated SEQ ID:1022, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1022 is located at position 108759 relative to the genome of Cercopithecine herpesvirus 7.

[14461] VGAM1036 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14462] An enzyme complex designated DICER COMPLEX, dices the VGAM1036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1036 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1036 RNA is designated SEQ ID:3747, and is provided hereinbelow with reference to the sequence listing part.

[14463] VGAM1036 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14464] VGAM1036 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1036 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1036 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14465] The complementary binding of VGAM1036 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1036 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1036 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14466] It is appreciated that VGAM1036 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1036 host target genes. The mRNA of each one of this plurality of VGAM1036 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1036 RNA, herein designated VGAM RNA, and which when bound by VGAM1036 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1036 host target proteins.

[14467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1036 gene, herein designated VGAM GENE, on one or more VGAM1036 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14468] It is yet further appreciated that a function of VGAM1036 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1036 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1036 correlate with, and may be deduced from, the identity of the host target genes which VGAM1036 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14469] Nucleotide sequences of the VGAM1036 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1036 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1036 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1036 are further described hereinbelow with reference to Table 1.

[14470] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1036 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14471] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1037 (VGAM1037) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14472] VGAM1037 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1037 was detected is described hereinabove with reference to Figs. 2-8.

[14473] VGAM1037 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14474] VGAM1037 gene, herein designated VGAM GENE, encodes a VGAM1037 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1037 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1037 precursor RNA is designated SEQ ID:1023, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1023 is located at position 96311 relative to the genome of Molluscum contagiosum virus.

[14475] VGAM1037 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14476] An enzyme complex designated DICER COMPLEX, dices the VGAM1037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1037 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1037 RNA is designated SEQ ID:3748, and is provided hereinbelow with reference to the sequence listing part.

[14477] VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14478] VGAM1037 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1037 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1037 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[14479] The complementary binding of VGAM1037 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1037 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1037 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14480] It is appreciated that VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1037 host target genes. The mRNA of each one of this plurality of VGAM1037 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1037 RNA, herein designated VGAM RNA, and which when bound by VGAM1037 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1037 host target proteins.

[14481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1037 gene, herein designated VGAM GENE, on one or more VGAM1037 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14482] It is yet further appreciated that a function of VGAM1037 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1037 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1037 correlate with, and may be deduced from, the identity of the host target genes which VGAM1037 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[14483] Nucleotide sequences of the VGAM1037 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1037 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1037 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1037 are further described hereinbelow with reference to Table 1.

[14484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1037 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14485] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1038 (VGAM1038) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14486] VGAM1038 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1038 was detected is described hereinabove with reference to Figs. 2–8.

[14487] VGAM1038 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14488] VGAM1038 gene, herein designated VGAM GENE, encodes a VGAM1038 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1038 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1038 precursor RNA is designated SEQ ID:1024, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1024 is located at position 96469 relative to the genome of Molluscum contagiosum virus.

[14489] VGAM1038 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14490] An enzyme complex designated DICER COMPLEX, dices the VGAM1038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1038 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1038 RNA is designated SEQ ID:3749, and is provided hereinbelow with reference to the sequence listing part.

[14491] VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14492] VGAM1038 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1038 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14493] The complementary binding of VGAM1038 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1038 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1038 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14494] It is appreciated that VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1038 host target genes. The mRNA of each one of this plurality of VGAM1038 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1038 RNA, herein designated VGAM RNA, and which when bound by VGAM1038 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1038 host target proteins.

[14495] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1038 gene, herein designated VGAM GENE, on one or more VGAM1038 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14496] It is yet further appreciated that a function of VGAM1038 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1038 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1038 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14497] Nucleotide sequences of the VGAM1038 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1038 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1038 are further described hereinbelow with reference to Table 1.

[14498] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1038 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14499] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1039 (VGAM1039) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14500] VGAM1039 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1039 was detected is described hereinabove with reference to Figs. 2–8.

[14501] VGAM1039 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14502] VGAM1039 gene, herein designated VGAM GENE, encodes a VGAM1039 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1039 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1039 precursor RNA is designated SEQ ID:1025, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1025 is located at position 95607 relative to the genome of Molluscum contagiosum virus.

[14503] VGAM1039 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1039 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14504] An enzyme complex designated DICER COMPLEX, dices the VGAM1039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1039 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1039 RNA is designated SEQ ID:3750, and is provided hereinbelow with reference to the sequence listing part.

[14505] VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1039 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14506] VGAM1039 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1039 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14507] The complementary binding of VGAM1039 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1039 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14508] It is appreciated that VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1039 host target genes. The mRNA of each one of this plurality of VGAM1039 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1039 RNA, herein designated VGAM RNA, and which when bound by VGAM1039 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1039 host target proteins.

[14509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1039 gene, herein designated VGAM GENE, on one or more VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14510] It is yet further appreciated that a function of VGAM1039 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum

virus. Specific functions, and accordingly utilities, of VGAM1039 correlate with, and may be deduced from, the identity of the host target genes which VGAM1039 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14511] Nucleotide sequences of the VGAM1039 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1039 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1039 are further described hereinbelow with reference to Table 1.

[14512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1039 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14513] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1040 (VGAM1040) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[14514] VGAM1040 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1040 was detected is described hereinabove with reference to Figs. 2–8.

[14515] VGAM1040 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM1040 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14516] VGAM1040 gene, herein designated VGAM GENE, encodes a VGAM1040 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1040 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1040 precursor RNA is designated SEQ ID:1026, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1026 is located at position 92882 relative to the genome of Molluscum contagiosum virus.

[14517] VGAM1040 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14518] An enzyme complex designated DICER COMPLEX, dices the VGAM1040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1040 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1040 RNA is designated SEQ ID:3751, and is provided hereinbelow with reference to the sequence listing part.

[14519] VGAM1040 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14520] VGAM1040 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1040 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1040 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14521] The complementary binding of VGAM1040 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1040 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14522] It is appreciated that VGAM1040 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1040 host target genes. The mRNA of each one of this plurality of VGAM1040 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1040 RNA, herein designated VGAM

RNA, and which when bound by VGAM1040 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1040 host target proteins.

[14523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1040 gene, herein designated VGAM GENE, on one or more VGAM1040 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14524] It is yet further appreciated that a function of VGAM1040 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1040 include diagnosis, prevention and treatment of viral infection by Mollusum contagiosum virus. Specific functions, and accordingly utilities, of VGAM1040 correlate with, and may be deduced from, the identity of the host target genes which VGAM1040 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14525] Nucleotide sequences of the VGAM1040 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1040 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1040 are further described hereinbelow with reference to Table 1.

[14526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1040 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14527] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1041 (VGAM1041) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14528] VGAM1041 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1041 was detected is described hereinabove with reference to Figs. 2-8.

[14529] VGAM1041 gene, herein designated VGAM GENE, is a viral gene contained in the genome of White clover mosaic virus. VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14530] VGAM1041 gene, herein designated VGAM GENE, encodes a VGAM1041 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1041 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1041 precursor RNA is designated SEQ ID:1027, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1027 is located at position 1636

relative to the genome of White clover mosaic virus.

[14531] VGAM1041 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14532] An enzyme complex designated DICER COMPLEX, dices the VGAM1041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1041 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1041 RNA is designated SEQ ID:3752, and is provided hereinbelow with reference to the sequence listing part.

[14533] VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14534] VGAM1041 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1041 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1041 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14535] The complementary binding of VGAM1041 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1041 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14536] It is appreciated that VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1041 host target genes. The mRNA of each one of this plurality of VGAM1041 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1041 RNA, herein designated VGAM RNA, and which when bound by VGAM1041 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1041 host target proteins.

[14537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1041 gene, herein designated VGAM GENE, on one or more VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14538] It is yet further appreciated that a function of VGAM1041 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of viral infection by White clover mosaic virus. Specific functions, and accordingly utilities, of VGAM1041 correlate with, and may be deduced from, the identity of the host target genes which VGAM1041 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14539] Nucleotide sequences of the VGAM1041 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1041 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1041 are further described hereinbelow with reference to Table 1.

[14540] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1041 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14541] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1042 (VGAM1042) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14542] VGAM1042 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1042 was detected is described hereinabove with reference to Figs. 2–8.

[14543] VGAM1042 gene, herein designated VGAM GENE, is a viral gene contained in the genome of White clover mosaic virus. VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14544] VGAM1042 gene, herein designated VGAM GENE, encodes a VGAM1042 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1042 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1042 precursor RNA is designated SEQ ID:1028, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1028 is located at position 3519 relative to the genome of White clover mosaic virus.

[14545] VGAM1042 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14546] An enzyme complex designated DICER COMPLEX, dices the VGAM1042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1042 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1042 RNA is designated SEQ ID:3753, and is provided hereinbelow with reference to the sequence

listing part.

[14547] VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14548] VGAM1042 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1042 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1042 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14549] The complementary binding of VGAM1042 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1042 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14550] It is appreciated that VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1042 host target genes. The mRNA of each one of this plurality of VGAM1042 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1042 RNA, herein designated VGAM RNA, and which when bound by VGAM1042 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1042 host target proteins.

[14551] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1042 gene, herein designated VGAM GENE, on one or more VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14552] It is yet further appreciated that a function of VGAM1042

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of viral infection by White clover mosaic virus. Specific functions, and accordingly utilities, of VGAM1042 correlate with, and may be deduced from, the identity of the host target genes which VGAM1042 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14553] Nucleotide sequences of the VGAM1042 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1042 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1042 are further described hereinbelow with reference to Table 1.

[14554] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1042 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14555] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1043 (VGAM1043) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14556] VGAM1043 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1043 was detected is described hereinabove with reference to Figs. 2–8.

[14557] VGAM1043 gene, herein designated VGAM GENE, is a viral gene contained in the genome of White clover mosaic virus. VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14558] VGAM1043 gene, herein designated VGAM GENE, encodes a VGAM1043 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1043 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1043 precursor RNA is designated SEQ ID:1029, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1029 is located at position 5056 relative to the genome of White clover mosaic virus.

[14559] VGAM1043 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14560] An enzyme complex designated DICER COMPLEX, dices the VGAM1043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1043 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1043 RNA is designated SEQ ID:3754, and

is provided hereinbelow with reference to the sequence listing part.

[14561] VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14562] VGAM1043 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1043 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14563] The complementary binding of VGAM1043 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1043 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14564] It is appreciated that VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1043 host target genes. The mRNA of each one of this plurality of VGAM1043 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1043 RNA, herein designated VGAM RNA, and which when bound by VGAM1043 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1043 host target proteins.

[14565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1043 gene, herein designated VGAM GENE, on one or more VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14566] It is yet further appreciated that a function of VGAM1043 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of viral infection by White clover mosaic virus. Specific functions, and accordingly utilities, of VGAM1043 correlate with, and may be deduced from, the identity of the host target genes which VGAM1043 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14567] Nucleotide sequences of the VGAM1043 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1043 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1043 are further described hereinbelow with reference to Table 1.

[14568] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1043 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14569] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1044 (VGAM1044) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14570] VGAM1044 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1044 was detected is described hereinabove with reference to Figs. 2–8.

[14571] VGAM1044 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14572] VGAM1044 gene, herein designated VGAM GENE, encodes a VGAM1044 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1044 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1044 precu-

sor RNA is designated SEQ ID:1030, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1030 is located at position 131364 relative to the genome of Human herpesvirus 8.

[14573] VGAM1044 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14574] An enzyme complex designated DICER COMPLEX, dices the VGAM1044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1044 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide se-

quence of VGAM1044 RNA is designated SEQ ID:3755, and is provided hereinbelow with reference to the sequence listing part.

[14575] VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14576] VGAM1044 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1044 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14577] The complementary binding of VGAM1044 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1044 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14578] It is appreciated that VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1044 host target genes. The mRNA of

each one of this plurality of VGAM1044 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1044 RNA, herein designated VGAM RNA, and which when bound by VGAM1044 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1044 host target proteins.

[14579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1044 gene, herein designated VGAM GENE, on one or more VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[14580] It is yet further appreciated that a function of VGAM1044 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1044 correlate with, and may be deduced from, the identity of the host target genes which VGAM1044 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14581] Nucleotide sequences of the VGAM1044 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1044 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1044 are further described hereinbelow with reference to Table 1.

[14582] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1044 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[14583] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1045 (VGAM1045) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14584] VGAM1045 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1045 was detected is described hereinabove with reference to Figs. 2–8.

[14585] VGAM1045 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV–1. VGAM1045 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14586] VGAM1045 gene, herein designated VGAM GENE, encodes a VGAM1045 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1045 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1045 precursor RNA is designated SEQ ID:1031, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1031 is located at position 26929 relative to the genome of Sulfolobus virus SIRV-1.

[14587] VGAM1045 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14588] An enzyme complex designated DICER COMPLEX, dices the VGAM1045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1045 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1045 RNA is designated SEQ ID:3756, and is provided hereinbelow with reference to the sequence listing part.

[14589] VGAM1045 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14590] VGAM1045 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1045 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14591] The complementary binding of VGAM1045 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1045 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14592] It is appreciated that VGAM1045 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1045 host target genes. The mRNA of each one of this plurality of VGAM1045 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1045 RNA, herein designated VGAM RNA, and which when bound by VGAM1045 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1045 host target proteins.

[14593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1045 gene, herein designated VGAM GENE, on one or more VGAM1045 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [14594] It is yet further appreciated that a function of VGAM1045 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM1045 correlate with, and may be deduced from, the identity of the host target genes which VGAM1045 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [14595] Nucleotide sequences of the VGAM1045 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1045 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1045 are further described hereinbelow with reference to Table 1.
- [14596] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1045 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14597] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1046 (VGAM1046) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14598] VGAM1046 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1046 was detected is described hereinabove with reference to Figs. 2-8.

[14599] VGAM1046 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM1046 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14600] VGAM1046 gene, herein designated VGAM GENE, encodes a VGAM1046 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1046 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1046 precursor RNA is designated SEQ ID:1032, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1032 is located at position 131131 relative to the genome of Human herpesvirus 8.

[14601] VGAM1046 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14602] An enzyme complex designated DICER COMPLEX, dices the VGAM1046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1046 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1046 RNA is designated SEQ ID:3757, and is provided hereinbelow with reference to the sequence listing part.

[14603] VGAM1046 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14604] VGAM1046 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1046 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1046 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14605] The complementary binding of VGAM1046 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1046 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14606] It is appreciated that VGAM1046 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1046 host target genes. The mRNA of each one of this plurality of VGAM1046 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1046 RNA, herein designated VGAM RNA, and which when bound by VGAM1046 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1046 host target proteins.

[14607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1046 gene, herein designated VGAM GENE, on one or more VGAM1046 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14608] It is yet further appreciated that a function of VGAM1046 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1046 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1046 correlate with, and may be deduced from, the identity of the host target genes which VGAM1046 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14609] Nucleotide sequences of the VGAM1046 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1046 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1046 are further described hereinbelow with reference to Table 1.

[14610] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1046 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14611] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1047 (VGAM1047) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14612] VGAM1047 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1047 was detected is described hereinabove with reference to Figs. 2–8.

[14613] VGAM1047 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mild yellow edge virus. VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14614] VGAM1047 gene, herein designated VGAM GENE, encodes a VGAM1047 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1047 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1047 precursor RNA is designated SEQ ID:1033, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1033 is located at position 3766 relative to the genome of Strawberry mild yellow edge virus.

[14615] VGAM1047 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14616] An enzyme complex designated DICER COMPLEX, dices the VGAM1047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1047 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1047 RNA is designated SEQ ID:3758, and is provided hereinbelow with reference to the sequence listing part.

[14617] VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14618] VGAM1047 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1047 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1047 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14619] The complementary binding of VGAM1047 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1047 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[14620] It is appreciated that VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1047 host target genes. The mRNA of each one of this plurality of VGAM1047 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1047 RNA, herein designated VGAM RNA, and which when bound by VGAM1047 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1047 host target proteins.

[14621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1047 gene, herein designated VGAM GENE, on one or more VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14622] It is yet further appreciated that a function of VGAM1047 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1047 include diagnosis, prevention and treatment of viral infection by Strawberry mild yellow edge virus. Specific functions, and accordingly utilities, of VGAM1047 correlate with, and may be deduced from, the identity of the host target genes which VGAM1047 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14623] Nucleotide sequences of the VGAM1047 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1047 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1047 are further described hereinbelow with reference to Table 1.

[14624] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1047 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14625] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1048 (VGAM1048) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14626] VGAM1048 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1048 was detected is described hereinabove with reference to Figs. 2-8.

[14627] VGAM1048 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mild yellow edge virus. VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14628] VGAM1048 gene, herein designated VGAM GENE, encodes a VGAM1048 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1048 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1048 precursor RNA is designated SEQ ID:1034, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1034 is located at position 1114 relative to the genome of Strawberry mild yellow edge virus.

[14629] VGAM1048 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14630] An enzyme complex designated DICER COMPLEX, dices the VGAM1048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1048 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1048 RNA is designated SEQ ID:3759, and is provided hereinbelow with reference to the sequence listing part.

[14631] VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14632] VGAM1048 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1048 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14633] The complementary binding of VGAM1048 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1048 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1048 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14634] It is appreciated that VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1048 host target genes. The mRNA of each one of this plurality of VGAM1048 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1048 RNA, herein designated VGAM RNA, and which when bound by VGAM1048 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1048 host target proteins.

[14635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1048 gene, herein designated VGAM GENE, on one or more VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14636] It is yet further appreciated that a function of VGAM1048 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of viral infection by Strawberry mild yellow edge virus. Specific functions, and accordingly utilities, of VGAM1048 correlate with, and may be deduced from, the identity of the host target genes which VGAM1048 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14637] Nucleotide sequences of the VGAM1048 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1048 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1048 are further

described hereinbelow with reference to Table 1.

[14638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1048 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14639] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1049 (VGAM1049) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14640] VGAM1049 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1049 was detected is described hereinabove with reference to Figs. 2-8.

[14641] VGAM1049 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mild yellow edge virus. VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14642] VGAM1049 gene, herein designated VGAM GENE, encodes a VGAM1049 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1049 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1049 precursor RNA is designated SEQ ID:1035, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1035 is located at position 4885 relative to the genome of Strawberry mild yellow edge virus.

[14643] VGAM1049 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14644] An enzyme complex designated DICER COMPLEX, dices

the VGAM1049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1049 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1049 RNA is designated SEQ ID:3760, and is provided hereinbelow with reference to the sequence listing part.

[14645] VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14646] VGAM1049 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1049 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1049 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1049 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14647] The complementary binding of VGAM1049 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1049 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14648] It is appreciated that VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1049 host target genes. The mRNA of each one of this plurality of VGAM1049 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1049 RNA, herein designated VGAM RNA, and which when bound by VGAM1049 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1049 host target proteins.

[14649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1049 gene, herein designated VGAM GENE, on one or more VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14650] It is yet further appreciated that a function of VGAM1049 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of viral infection by Strawberry mild yellow edge virus. Specific functions, and accordingly utilities, of VGAM1049 correlate with, and may be deduced from, the identity of the host target genes which VGAM1049 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14651] Nucleotide sequences of the VGAM1049 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1049 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1049 are further described hereinbelow with reference to Table 1.

[14652] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1049 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14653] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1050 (VGAM1050) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14654] VGAM1050 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1050 was detected is described hereinabove with reference to Figs. 2-8.

[14655] VGAM1050 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM1050 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[14656] VGAM1050 gene, herein designated VGAM GENE, encodes a VGAM1050 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1050 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1050 precursor RNA is designated SEQ ID:1036, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1036 is located at position 108185 relative to the genome of Meleagrid herpesvirus 1.

[14657] VGAM1050 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[14658] An enzyme complex designated DICER COMPLEX, dices the VGAM1050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1050 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1050 RNA is designated SEQ ID:3761, and is provided hereinbelow with reference to the sequence listing part.

[14659] VGAM1050 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14660] VGAM1050 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1050 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14661] The complementary binding of VGAM1050 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1050 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14662] It is appreciated that VGAM1050 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1050 host target genes. The mRNA of each one of this plurality of VGAM1050 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1050 RNA, herein designated VGAM RNA, and which when bound by VGAM1050 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1050 host target proteins.

[14663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1050 gene, herein designated VGAM GENE, on one or more VGAM1050 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14664] It is yet further appreciated that a function of VGAM1050 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1050 correlate with, and may be deduced from, the identity of the host target genes which VGAM1050 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14665] Nucleotide sequences of the VGAM1050 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1050 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1050 are further described hereinbelow with reference to Table 1.

[14666] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1050 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14667] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1051 (VGAM1051) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14668] VGAM1051 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1051 was detected is described hereinabove with reference to Figs. 2-8.

[14669] VGAM1051 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Meleagrid herpesvirus 1. VGAM1051 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14670] VGAM1051 gene, herein designated VGAM GENE, encodes a VGAM1051 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1051 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1051 precursor RNA is designated SEQ ID:1037, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1037 is located at position 110396 relative to the genome of Meleagrid herpesvirus 1.

[14671] VGAM1051 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14672] An enzyme complex designated DICER COMPLEX, dices the VGAM1051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1051 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1051 RNA is designated SEQ ID:3762, and is provided hereinbelow with reference to the sequence listing part.

[14673] VGAM1051 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[14674] VGAM1051 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1051 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1051 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14675] The complementary binding of VGAM1051 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1051 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14676] It is appreciated that VGAM1051 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1051 host target genes. The mRNA of each one of this plurality of VGAM1051 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1051 RNA, herein designated VGAM RNA, and which when bound by VGAM1051 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1051 host target proteins.

[14677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1051 gene, herein designated VGAM GENE, on one

or more VGAM1051 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14678] It is yet further appreciated that a function of VGAM1051 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1051 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1051 correlate with, and may be deduced from, the identity of the host target genes which VGAM1051 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14679] Nucleotide sequences of the VGAM1051 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1051 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1051 are further described hereinbelow with reference to Table 1.

[14680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1051 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14681] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1052 (VGAM1052) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14682] VGAM1052 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1052 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[14683] VGAM1052 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14684] VGAM1052 gene, herein designated VGAM GENE, encodes a VGAM1052 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1052 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1052 precursor RNA is designated SEQ ID:1038, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1038 is located at position 106911 relative to the genome of Meleagrid herpesvirus 1.

[14685] VGAM1052 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14686] An enzyme complex designated DICER COMPLEX, dices the VGAM1052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1052 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1052 RNA is designated SEQ ID:3763, and is provided hereinbelow with reference to the sequence listing part.

[14687] VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14688] VGAM1052 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1052 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14689] The complementary binding of VGAM1052 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1052 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14690] It is appreciated that VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1052 host target genes. The mRNA of each one of this plurality of VGAM1052 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1052 RNA, herein designated VGAM RNA, and which when bound by VGAM1052 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1052 host target proteins.

[14691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1052 gene, herein designated VGAM GENE, on one or more VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14692] It is yet further appreciated that a function of VGAM1052 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1052 correlate with, and may be deduced from, the identity of the host target genes which VGAM1052 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[14693] Nucleotide sequences of the VGAM1052 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1052 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1052 are further described hereinbelow with reference to Table 1.

[14694] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1052 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14695] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1053 (VGAM1053) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14696] VGAM1053 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1053 was detected is described hereinabove with reference to Figs. 2–8.

[14697] VGAM1053 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14698] VGAM1053 gene, herein designated VGAM GENE, encodes a VGAM1053 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1053 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1053 precursor RNA is designated SEQ ID:1039, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1039 is located at position 104991 relative to the genome of Meleagrid herpesvirus 1.

[14699] VGAM1053 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1053 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14700] An enzyme complex designated DICER COMPLEX, dices the VGAM1053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1053 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1053 RNA is designated SEQ ID:3764, and is provided hereinbelow with reference to the sequence listing part.

[14701] VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1053 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14702] VGAM1053 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1053 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1053 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14703] The complementary binding of VGAM1053 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1053 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14704] It is appreciated that VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1053 host target genes. The mRNA of each one of this plurality of VGAM1053 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1053 RNA, herein designated VGAM RNA, and which when bound by VGAM1053 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1053 host target proteins.

[14705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1053 gene, herein designated VGAM GENE, on one or more VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14706] It is yet further appreciated that a function of VGAM1053 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1053 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1053

correlate with, and may be deduced from, the identity of the host target genes which VGAM1053 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14707] Nucleotide sequences of the VGAM1053 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1053 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1053 are further described hereinbelow with reference to Table 1.

[14708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1053 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14709] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1054 (VGAM1054) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[14710] VGAM1054 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1054 was detected is described hereinabove with reference to Figs. 2–8.

[14711] VGAM1054 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14712] VGAM1054 gene, herein designated VGAM GENE, encodes a VGAM1054 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1054 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1054 precursor RNA is designated SEQ ID:1040, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1040 is located at position 193129 relative to the genome of Melanoplus sanguinipes entomopoxvirus.

[14713] VGAM1054 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14714] An enzyme complex designated DICER COMPLEX, dices the VGAM1054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1054 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1054 RNA is designated SEQ ID:3765, and is provided hereinbelow with reference to the sequence listing part.

[14715] VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14716] VGAM1054 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1054 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1054 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1054 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14717] The complementary binding of VGAM1054 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1054 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14718] It is appreciated that VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1054 host target genes. The mRNA of each one of this plurality of VGAM1054 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1054 RNA, herein designated VGAM RNA, and which when bound by VGAM1054 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1054 host target proteins.

[14719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1054 gene, herein designated VGAM GENE, on one or more VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14720] It is yet further appreciated that a function of VGAM1054 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1054 include diagnosis, prevention and

treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1054 correlate with, and may be deduced from, the identity of the host target genes which VGAM1054 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14721] Nucleotide sequences of the VGAM1054 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1054 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1054 are further described hereinbelow with reference to Table 1.

[14722] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1054 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14723] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1055 (VGAM1055) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14724] VGAM1055 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1055 was detected is described hereinabove with reference to Figs. 2–8.

[14725] VGAM1055 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mayaro virus. VGAM1055 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14726] VGAM1055 gene, herein designated VGAM GENE, encodes a VGAM1055 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1055 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1055 precursor RNA is designated SEQ ID:1041, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1041 is located at position 10628 relative to the genome of Mayaro virus.

[14727] VGAM1055 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14728] An enzyme complex designated DICER COMPLEX, dices the VGAM1055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1055 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1055 RNA is designated SEQ ID:3766, and is provided hereinbelow with reference to the sequence listing part.

[14729] VGAM1055 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14730] VGAM1055 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1055 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1055 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14731] The complementary binding of VGAM1055 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1055 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14732] It is appreciated that VGAM1055 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1055 host target genes. The mRNA of each one of this plurality of VGAM1055 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1055 RNA, herein designated VGAM

RNA, and which when bound by VGAM1055 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1055 host target proteins.

[14733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1055 gene, herein designated VGAM GENE, on one or more VGAM1055 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14734] It is yet further appreciated that a function of VGAM1055 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1055 include diagnosis, prevention and treatment of viral infection by Mayaro virus. Specific functions, and accordingly utilities, of VGAM1055 correlate with, and may be deduced from, the identity of the host target genes which VGAM1055 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14735] Nucleotide sequences of the VGAM1055 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1055 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1055 are further described hereinbelow with reference to Table 1.

[14736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1055 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14737] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1056 (VGAM1056) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14738] VGAM1056 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1056 was detected is described hereinabove with reference to Figs. 2-8.

[14739] VGAM1056 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mayaro virus. VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14740] VGAM1056 gene, herein designated VGAM GENE, encodes a VGAM1056 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1056 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1056 precursor RNA is designated SEQ ID:1042, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1042 is located at position

10251 relative to the genome of Mayaro virus.

[14741] VGAM1056 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14742] An enzyme complex designated DICER COMPLEX, dices the VGAM1056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1056 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1056 RNA is designated SEQ ID:3767, and is provided hereinbelow with reference to the sequence listing part.

[14743] VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14744] VGAM1056 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1056 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1056 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14745] The complementary binding of VGAM1056 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1056 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14746] It is appreciated that VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1056 host target genes. The mRNA of each one of this plurality of VGAM1056 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1056 RNA, herein designated VGAM RNA, and which when bound by VGAM1056 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1056 host target proteins.

[14747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1056 gene, herein designated VGAM GENE, on one or more VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14748] It is yet further appreciated that a function of VGAM1056 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1056 include diagnosis, prevention and treatment of viral infection by Mayaro virus. Specific functions, and accordingly utilities, of VGAM1056 correlate with, and may be deduced from, the identity of the host target genes which VGAM1056 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14749] Nucleotide sequences of the VGAM1056 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1056 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1056 are further described hereinbelow with reference to Table 1.

[14750] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1056 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14751] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1057 (VGAM1057) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14752] VGAM1057 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1057 was detected is described hereinabove with reference to Figs. 2–8.

[14753] VGAM1057 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14754] VGAM1057 gene, herein designated VGAM GENE, encodes a VGAM1057 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1057 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1057 precursor RNA is designated SEQ ID:1043, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1043 is located at position 101664 relative to the genome of murid herpesvirus 4.

[14755] VGAM1057 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14756] An enzyme complex designated DICER COMPLEX, dices the VGAM1057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1057 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM1057 RNA is designated SEQ ID:3768, and is provided hereinbelow with reference to the sequence

listing part.

[14757] VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14758] VGAM1057 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1057 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1057 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14759] The complementary binding of VGAM1057 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1057 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14760] It is appreciated that VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1057 host target genes. The mRNA of each one of this plurality of VGAM1057 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1057 RNA, herein designated VGAM RNA, and which when bound by VGAM1057 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1057 host target proteins.

[14761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1057 gene, herein designated VGAM GENE, on one or more VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14762] It is yet further appreciated that a function of VGAM1057

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1057 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1057 correlate with, and may be deduced from, the identity of the host target genes which VGAM1057 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14763] Nucleotide sequences of the VGAM1057 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1057 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1057 are further described hereinbelow with reference to Table 1.

[14764] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1057 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14765] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1058 (VGAM1058) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14766] VGAM1058 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1058 was detected is described hereinabove with reference to Figs. 2–8.

[14767] VGAM1058 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14768] VGAM1058 gene, herein designated VGAM GENE, encodes a VGAM1058 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1058 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1058 precursor RNA is designated SEQ ID:1044, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1044 is located at position 98739 relative to the genome of murid herpesvirus 4.

[14769] VGAM1058 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14770] An enzyme complex designated DICER COMPLEX, dices the VGAM1058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1058 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1058 RNA is designated SEQ ID:3769, and

is provided hereinbelow with reference to the sequence listing part.

[14771] VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14772] VGAM1058 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1058 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14773] The complementary binding of VGAM1058 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1058 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14774] It is appreciated that VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1058 host target genes. The mRNA of each one of this plurality of VGAM1058 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1058 RNA, herein designated VGAM RNA, and which when bound by VGAM1058 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1058 host target proteins.

[14775] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1058 gene, herein designated VGAM GENE, on one or more VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14776] It is yet further appreciated that a function of VGAM1058 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1058 correlate with, and may be deduced from, the identity of the host target genes which VGAM1058 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14777] Nucleotide sequences of the VGAM1058 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1058 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1058 are further described hereinbelow with reference to Table 1.

[14778] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1058 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14779] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1059 (VGAM1059) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14780] VGAM1059 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1059 was detected is described hereinabove with reference to Figs. 2–8.

[14781] VGAM1059 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14782] VGAM1059 gene, herein designated VGAM GENE, encodes a VGAM1059 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1059 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1059 precu-

sor RNA is designated SEQ ID:1045, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1045 is located at position 97788 relative to the genome of murid herpesvirus 4.

[14783] VGAM1059 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14784] An enzyme complex designated DICER COMPLEX, dices the VGAM1059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1059 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1059 RNA is designated SEQ ID:3770, and is provided hereinbelow with reference to the sequence listing part.

[14785] VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14786] VGAM1059 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1059 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14787] The complementary binding of VGAM1059 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1059 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14788] It is appreciated that VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1059 host target genes. The mRNA of

each one of this plurality of VGAM1059 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1059 RNA, herein designated VGAM RNA, and which when bound by VGAM1059 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1059 host target proteins.

[14789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1059 gene, herein designated VGAM GENE, on one or more VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[14790] It is yet further appreciated that a function of VGAM1059 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1059 correlate with, and may be deduced from, the identity of the host target genes which VGAM1059 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14791] Nucleotide sequences of the VGAM1059 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1059 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1059 are further described hereinbelow with reference to Table 1.

[14792] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1059 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[14793] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1060 (VGAM1060) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14794] VGAM1060 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1060 was detected is described hereinabove with reference to Figs. 2–8.

[14795] VGAM1060 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato mop-top virus. VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14796] VGAM1060 gene, herein designated VGAM GENE, encodes a VGAM1060 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1060 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1060 precursor RNA is designated SEQ ID:1046, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1046 is located at position 2755 relative to the genome of Potato mop-top virus.

[14797] VGAM1060 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14798] An enzyme complex designated DICER COMPLEX, dices the VGAM1060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1060 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1060 RNA is designated SEQ ID:3771, and is provided hereinbelow with reference to the sequence listing part.

[14799] VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14800] VGAM1060 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1060 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14801] The complementary binding of VGAM1060 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1060 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14802] It is appreciated that VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1060 host target genes. The mRNA of each one of this plurality of VGAM1060 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1060 RNA, herein designated VGAM RNA, and which when bound by VGAM1060 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1060 host target proteins.

[14803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1060 gene, herein designated VGAM GENE, on one or more VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [14804] It is yet further appreciated that a function of VGAM1060 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of viral infection by Potato mop-top virus. Specific functions, and accordingly utilities, of VGAM1060 correlate with, and may be deduced from, the identity of the host target genes which VGAM1060 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [14805] Nucleotide sequences of the VGAM1060 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1060 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1060 are further described hereinbelow with reference to Table 1.
- [14806] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1060 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14807] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1061 (VGAM1061) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14808] VGAM1061 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1061 was detected is described hereinabove with reference to Figs. 2–8.

[14809] VGAM1061 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine adenovirus type 1. VGAM1061 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14810] VGAM1061 gene, herein designated VGAM GENE, encodes a VGAM1061 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1061 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1061 precursor RNA is designated SEQ ID:1047, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1047 is located at position 7412 relative to the genome of Canine adenovirus type 1.

[14811] VGAM1061 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14812] An enzyme complex designated DICER COMPLEX, dices the VGAM1061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1061 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1061 RNA is designated SEQ ID:3772, and is provided hereinbelow with reference to the sequence listing part.

[14813] VGAM1061 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14814] VGAM1061 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1061 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14815] The complementary binding of VGAM1061 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1061 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14816] It is appreciated that VGAM1061 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1061 host target genes. The mRNA of each one of this plurality of VGAM1061 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1061 RNA, herein designated VGAM RNA, and which when bound by VGAM1061 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1061 host target proteins.

[14817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1061 gene, herein designated VGAM GENE, on one or more VGAM1061 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14818] It is yet further appreciated that a function of VGAM1061 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of viral infection by Canine adenovirus type 1. Specific functions, and accordingly utilities, of VGAM1061 correlate with, and may be deduced from, the identity of the host target genes which VGAM1061 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14819] Nucleotide sequences of the VGAM1061 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1061 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1061 are further described hereinbelow with reference to Table 1.

[14820] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1061 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14821] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1062 (VGAM1062) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14822] VGAM1062 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1062 was detected is described hereinabove with reference to Figs. 2–8.

[14823] VGAM1062 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine adenovirus type 1. VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14824] VGAM1062 gene, herein designated VGAM GENE, encodes a VGAM1062 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1062 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1062 precursor RNA is designated SEQ ID:1048, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1048 is located at position 6331 relative to the genome of Canine adenovirus type 1.

[14825] VGAM1062 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14826] An enzyme complex designated DICER COMPLEX, dices the VGAM1062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1062 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1062 RNA is designated SEQ ID:3773, and is provided hereinbelow with reference to the sequence listing part.

[14827] VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14828] VGAM1062 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1062 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1062 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14829] The complementary binding of VGAM1062 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1062 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14830] It is appreciated that VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1062 host target genes. The mRNA of each one of this plurality of VGAM1062 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1062 RNA, herein designated VGAM RNA, and which when bound by VGAM1062 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1062 host target proteins.

[14831] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1062 gene, herein designated VGAM GENE, on one or more VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14832] It is yet further appreciated that a function of VGAM1062 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1062 include diagnosis, prevention and treatment of viral infection by Canine adenovirus type 1. Specific functions, and accordingly utilities, of VGAM1062 correlate with, and may be deduced from, the identity of the host target genes which VGAM1062 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14833] Nucleotide sequences of the VGAM1062 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1062 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1062 are further described hereinbelow with reference to Table 1.

[14834] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1062 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14835] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1063 (VGAM1063) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14836] VGAM1063 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1063 was detected is described hereinabove with reference to Figs. 2-8.

[14837] VGAM1063 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip virus X. VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14838] VGAM1063 gene, herein designated VGAM GENE, encodes a VGAM1063 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1063 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1063 precursor RNA is designated SEQ ID:1049, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1049 is located at position 2404 relative to the genome of Tulip virus X.

[14839] VGAM1063 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14840] An enzyme complex designated DICER COMPLEX, dices the VGAM1063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1063 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1063 RNA is designated SEQ ID:3774, and is provided hereinbelow with reference to the sequence listing part.

[14841] VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14842] VGAM1063 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1063 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14843] The complementary binding of VGAM1063 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1063 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14844] It is appreciated that VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1063 host target genes. The mRNA of each one of this plurality of VGAM1063 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1063 RNA, herein designated VGAM RNA, and which when bound by VGAM1063 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1063 host target proteins.

[14845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1063 gene, herein designated VGAM GENE, on one or more VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14846] It is yet further appreciated that a function of VGAM1063 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of viral infection by Tulip virus X. Specific functions, and accordingly utilities, of VGAM1063 correlate with, and may be deduced from, the identity of the host target genes which VGAM1063 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14847] Nucleotide sequences of the VGAM1063 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1063 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1063 are further described hereinbelow with reference to Table 1.

[14848] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1063 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14849] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1064 (VGAM1064) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14850] VGAM1064 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1064 was detected is described hereinabove with reference to Figs. 2-8.

[14851] VGAM1064 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip virus X. VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14852] VGAM1064 gene, herein designated VGAM GENE, encodes a VGAM1064 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1064 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1064 precursor RNA is designated SEQ ID:1050, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1050 is located at position 3436 relative to the genome of Tulip virus X.

[14853] VGAM1064 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14854] An enzyme complex designated DICER COMPLEX, dices the VGAM1064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1064 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1064 RNA is designated SEQ ID:3775, and is provided hereinbelow with reference to the sequence listing part.

[14855] VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14856] VGAM1064 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1064 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14857] The complementary binding of VGAM1064 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1064 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14858] It is appreciated that VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1064 host target genes. The mRNA of each one of this plurality of VGAM1064 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1064 RNA, herein designated VGAM RNA, and which when bound by VGAM1064 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1064 host target proteins.

[14859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1064 gene, herein designated VGAM GENE, on one or more VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14860] It is yet further appreciated that a function of VGAM1064 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of viral infection by Tulip virus X. Specific functions, and accordingly utilities, of VGAM1064 correlate with, and may be deduced from, the identity of the host target genes which VGAM1064 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14861] Nucleotide sequences of the VGAM1064 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1064 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1064 are further described hereinbelow with reference to Table 1.

[14862] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1064 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14863] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1065 (VGAM1065) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14864] VGAM1065 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1065 was detected is described hereinabove with reference to Figs. 2-8.

[14865] VGAM1065 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip virus X. VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14866] VGAM1065 gene, herein designated VGAM GENE, encodes a VGAM1065 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1065 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1065 precursor RNA is designated SEQ ID:1051, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1051 is located at position 1206 relative to the genome of Tulip virus X.

[14867] VGAM1065 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14868] An enzyme complex designated DICER COMPLEX, dices the VGAM1065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1065 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1065 RNA is designated SEQ ID:3776, and is provided hereinbelow with reference to the sequence listing part.

[14869] VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14870] VGAM1065 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1065 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1065 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14871] The complementary binding of VGAM1065 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1065 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14872] It is appreciated that VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1065 host target genes. The mRNA of each one of this plurality of VGAM1065 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1065 RNA, herein designated VGAM RNA, and which when bound by VGAM1065 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1065 host target proteins.

[14873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1065 gene, herein designated VGAM GENE, on one or more VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14874] It is yet further appreciated that a function of VGAM1065 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1065 include diagnosis, prevention and treatment of viral infection by Tulip virus X. Specific functions, and accordingly utilities, of VGAM1065 correlate with, and may be deduced from, the identity of the host target genes which VGAM1065 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14875] Nucleotide sequences of the VGAM1065 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1065 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1065 are further described hereinbelow with reference to Table 1.

[14876] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1065 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14877] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1066 (VGAM1066) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14878] VGAM1066 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1066 was detected is described hereinabove with reference to Figs. 2-8.

[14879] VGAM1066 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip virus X. VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14880] VGAM1066 gene, herein designated VGAM GENE, encodes a VGAM1066 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1066 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1066 precursor RNA is designated SEQ ID:1052, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1052 is located at position 2880 relative to the genome of Tulip virus X.

[14881] VGAM1066 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14882] An enzyme complex designated DICER COMPLEX, dices the VGAM1066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1066 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1066 RNA is designated SEQ ID:3777, and is provided hereinbelow with reference to the sequence listing part.

[14883] VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14884] VGAM1066 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1066 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1066 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14885] The complementary binding of VGAM1066 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1066 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14886] It is appreciated that VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1066 host target genes. The mRNA of each one of this plurality of VGAM1066 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1066 RNA, herein designated VGAM RNA, and which when bound by VGAM1066 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1066 host target proteins.

[14887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1066 gene, herein designated VGAM GENE, on one or more VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14888] It is yet further appreciated that a function of VGAM1066 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1066 include diagnosis, prevention and treatment of viral infection by Tulip virus X. Specific functions, and accordingly utilities, of VGAM1066 correlate with, and may be deduced from, the identity of the host target genes which VGAM1066 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14889] Nucleotide sequences of the VGAM1066 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1066 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1066 are further described hereinbelow with reference to Table 1.

[14890] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1066 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14891] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1067 (VGAM1067) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14892] VGAM1067 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1067 was detected is described hereinabove with reference to Figs. 2-8.

[14893] VGAM1067 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1067 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14894] VGAM1067 gene, herein designated VGAM GENE, encodes a VGAM1067 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1067 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1067 precursor RNA is designated SEQ ID:1053, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1053 is located at position 2170 relative to the genome of porcine epidemic diarrhea virus.

[14895] VGAM1067 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14896] An enzyme complex designated DICER COMPLEX, dices the VGAM1067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1067 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1067 RNA is designated SEQ ID:3778, and is provided hereinbelow with reference to the sequence listing part.

[14897] VGAM1067 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14898] VGAM1067 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1067 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14899] The complementary binding of VGAM1067 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1067 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[14900] It is appreciated that VGAM1067 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1067 host target genes. The mRNA of each one of this plurality of VGAM1067 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1067 RNA, herein designated VGAM RNA, and which when bound by VGAM1067 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1067 host target proteins.

[14901] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1067 gene, herein designated VGAM GENE, on one or more VGAM1067 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14902] It is yet further appreciated that a function of VGAM1067 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1067 correlate with, and may be deduced from, the identity of the host target genes which VGAM1067 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14903] Nucleotide sequences of the VGAM1067 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1067 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1067 are further described hereinbelow with reference to Table 1.

[14904] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1067 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14905] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1068 (VGAM1068) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14906] VGAM1068 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1068 was detected is described hereinabove with reference to Figs. 2-8.

[14907] VGAM1068 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14908] VGAM1068 gene, herein designated VGAM GENE, encodes a VGAM1068 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1068 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1068 precursor RNA is designated SEQ ID:1054, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1054 is located at position 12381 relative to the genome of porcine epidemic diarrhea virus.

[14909] VGAM1068 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14910] An enzyme complex designated DICER COMPLEX, dices the VGAM1068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1068 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1068 RNA is designated SEQ ID:3779, and is provided hereinbelow with reference to the sequence listing part.

[14911] VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14912] VGAM1068 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1068 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14913] The complementary binding of VGAM1068 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1068 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1068 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14914] It is appreciated that VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1068 host target genes. The mRNA of each one of this plurality of VGAM1068 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1068 RNA, herein designated VGAM RNA, and which when bound by VGAM1068 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1068 host target proteins.

[14915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1068 gene, herein designated VGAM GENE, on one or more VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14916] It is yet further appreciated that a function of VGAM1068 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1068 correlate with, and may be deduced from, the identity of the host target genes which VGAM1068 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14917] Nucleotide sequences of the VGAM1068 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1068 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1068 are further

described hereinbelow with reference to Table 1.

[14918] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1068 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14919] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1069 (VGAM1069) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14920] VGAM1069 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1069 was detected is described hereinabove with reference to Figs. 2-8.

[14921] VGAM1069 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14922] VGAM1069 gene, herein designated VGAM GENE, encodes a VGAM1069 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1069 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1069 precursor RNA is designated SEQ ID:1055, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1055 is located at position 4727 relative to the genome of porcine epidemic diarrhea virus.

[14923] VGAM1069 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14924] An enzyme complex designated DICER COMPLEX, dices the VGAM1069 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1069 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1069 RNA is designated SEQ ID:3780, and is provided hereinbelow with reference to the sequence listing part.

[14925] VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14926] VGAM1069 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1069 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14927] The complementary binding of VGAM1069 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1069

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1069 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14928] It is appreciated that VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1069 host target genes. The mRNA of each one of this plurality of VGAM1069 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1069 RNA, herein designated VGAM RNA, and which when bound by VGAM1069 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1069 host target proteins.

[14929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1069 gene, herein designated VGAM GENE, on one or more VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14930] It is yet further appreciated that a function of VGAM1069 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1069 correlate with, and may be deduced from, the identity of the host target genes which VGAM1069 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14931] Nucleotide sequences of the VGAM1069 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1069 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1069 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1069 are further described hereinbelow with reference to Table 1.

[14932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1069 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14933] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1070 (VGAM1070) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14934] VGAM1070 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1070 was detected is described hereinabove with reference to Figs. 2-8.

[14935] VGAM1070 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[14936] VGAM1070 gene, herein designated VGAM GENE, encodes a VGAM1070 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1070 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1070 precursor RNA is designated SEQ ID:1056, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1056 is located at position 6437 relative to the genome of porcine epidemic diarrhea virus.

[14937] VGAM1070 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14938] An enzyme complex designated DICER COMPLEX, dices

the VGAM1070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1070 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1070 RNA is designated SEQ ID:3781, and is provided hereinbelow with reference to the sequence listing part.

[14939] VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14940] VGAM1070 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1070 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1070 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14941] The complementary binding of VGAM1070 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1070 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14942] It is appreciated that VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1070 host target genes. The mRNA of each one of this plurality of VGAM1070 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1070 RNA, herein designated VGAM RNA, and which when bound by VGAM1070 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1070 host target proteins.

[14943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1070 gene, herein designated VGAM GENE, on one or more VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14944] It is yet further appreciated that a function of VGAM1070 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1070 correlate with, and may be deduced from, the identity of the host target genes which VGAM1070 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14945] Nucleotide sequences of the VGAM1070 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1070 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1070 are further described hereinbelow with reference to Table 1.

[14946] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1070 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14947] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1071 (VGAM1071) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14948] VGAM1071 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1071 was detected is described hereinabove with reference to Figs. 2-8.

[14949] VGAM1071 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhoea virus. VGAM1071 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14950] VGAM1071 gene, herein designated VGAM GENE, encodes a VGAM1071 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1071 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1071 precursor RNA is designated SEQ ID:1057, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1057 is located at position 5412 relative to the genome of porcine epidemic diarrhea virus.

[14951] VGAM1071 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14952] An enzyme complex designated DICER COMPLEX, dices the VGAM1071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1071 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1071 RNA is designated SEQ ID:3782, and is provided hereinbelow with reference to the sequence listing part.

[14953] VGAM1071 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14954] VGAM1071 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1071 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1071 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14955] The complementary binding of VGAM1071 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1071 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1071 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14956] It is appreciated that VGAM1071 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1071 host target genes. The mRNA of each one of this plurality of VGAM1071 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1071 RNA, herein designated VGAM RNA, and which when bound by VGAM1071 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1071 host target proteins.

[14957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1071 gene, herein designated VGAM GENE, on one or more VGAM1071 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14958] It is yet further appreciated that a function of VGAM1071 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1071 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1071 correlate with, and may be deduced from, the identity of the host target genes which VGAM1071 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14959] Nucleotide sequences of the VGAM1071 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1071 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1071 are further described hereinbelow with reference to Table 1.

[14960] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1071 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14961] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1072 (VGAM1072) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14962] VGAM1072 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1072 was detected is described hereinabove with reference to Figs. 2-8.

[14963] VGAM1072 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diar-

rhea virus. VGAM1072 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14964] VGAM1072 gene, herein designated VGAM GENE, encodes a VGAM1072 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1072 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1072 precursor RNA is designated SEQ ID:1058, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1058 is located at position 10299 relative to the genome of porcine epidemic diarrhoea virus.

[14965] VGAM1072 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14966] An enzyme complex designated DICER COMPLEX, dices the VGAM1072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1072 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1072 RNA is designated SEQ ID:3783, and is provided hereinbelow with reference to the sequence listing part.

[14967] VGAM1072 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14968] VGAM1072 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1072 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1072 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14969] The complementary binding of VGAM1072 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1072 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14970] It is appreciated that VGAM1072 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1072 host target genes. The mRNA of each one of this plurality of VGAM1072 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1072 RNA, herein designated VGAM RNA, and which when bound by VGAM1072 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1072 host target proteins.

[14971] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1072 gene, herein designated VGAM GENE, on one or more VGAM1072 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14972] It is yet further appreciated that a function of VGAM1072 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1072 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1072 correlate with, and may be deduced from, the identity of the host target genes which VGAM1072 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14973] Nucleotide sequences of the VGAM1072 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1072 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1072 are further described hereinbelow with reference to Table 1.

[14974] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1072 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14975] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1073 (VGAM1073) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14976] VGAM1073 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1073 was detected is described hereinabove with reference to Figs. 2-8.

[14977] VGAM1073 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14978] VGAM1073 gene, herein designated VGAM GENE, encodes a VGAM1073 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1073 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1073 precursor RNA is designated SEQ ID:1059, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1059 is located at position 11550 relative to the genome of porcine epidemic diarrhea virus.

[14979] VGAM1073 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14980] An enzyme complex designated DICER COMPLEX, dices the VGAM1073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1073 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1073 RNA is designated SEQ ID:3784, and is provided hereinbelow with reference to the sequence listing part.

[14981] VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14982] VGAM1073 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1073 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1073 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[14983] The complementary binding of VGAM1073 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1073 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14984] It is appreciated that VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1073 host target genes. The mRNA of each one of this plurality of VGAM1073 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1073 RNA, herein designated VGAM RNA, and which when bound by VGAM1073 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1073 host target proteins.

[14985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1073 gene, herein designated VGAM GENE, on one or more VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[14986] It is yet further appreciated that a function of VGAM1073 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1073 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1073 correlate with, and may be deduced from, the identity of the host target genes which VGAM1073 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[14987] Nucleotide sequences of the VGAM1073 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1073 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1073 are further described hereinbelow with reference to Table 1.

[14988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1073 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14989] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1074 (VGAM1074) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14990] VGAM1074 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1074 was detected is described hereinabove with reference to Figs. 2–8.

[14991] VGAM1074 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14992] VGAM1074 gene, herein designated VGAM GENE, encodes a VGAM1074 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1074 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1074 precursor RNA is designated SEQ ID:1060, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1060 is located at position 2902 relative to the genome of porcine epidemic diarrhea virus.

[14993] VGAM1074 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14994] An enzyme complex designated DICER COMPLEX, dices the VGAM1074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1074 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1074 RNA is designated SEQ ID:3785, and is provided hereinbelow with reference to the sequence listing part.

[14995] VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[14996] VGAM1074 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1074 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[14997] The complementary binding of VGAM1074 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1074 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14998] It is appreciated that VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1074 host target genes. The mRNA of each one of this plurality of VGAM1074 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1074 RNA, herein designated VGAM RNA, and which when bound by VGAM1074 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1074 host target proteins.

[14999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1074 gene, herein designated VGAM GENE, on one or more VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15000] It is yet further appreciated that a function of VGAM1074 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1074 correlate with, and may be deduced from, the identity of the host target genes which VGAM1074 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15001] Nucleotide sequences of the VGAM1074 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1074 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1074 are further described hereinbelow with reference to Table 1.

[15002] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1074 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15003] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1075 (VGAM1075) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15004] VGAM1075 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1075 was detected is described hereinabove with reference to Figs. 2–8.

[15005] VGAM1075 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15006] VGAM1075 gene, herein designated VGAM GENE, encodes a VGAM1075 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1075 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1075 precursor RNA is designated SEQ ID:1061, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1061 is located at position 17939 relative to the genome of porcine epidemic diarrhea virus.

[15007] VGAM1075 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1075 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15008] An enzyme complex designated DICER COMPLEX, dices the VGAM1075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1075 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1075 RNA is designated SEQ ID:3786, and is provided hereinbelow with reference to the sequence listing part.

[15009] VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1075 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15010] VGAM1075 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1075 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1075 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15011] The complementary binding of VGAM1075 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1075 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15012] It is appreciated that VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1075 host target genes. The mRNA of each one of this plurality of VGAM1075 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1075 RNA, herein designated VGAM RNA, and which when bound by VGAM1075 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1075 host target proteins.

[15013] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1075 gene, herein designated VGAM GENE, on one or more VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15014] It is yet further appreciated that a function of VGAM1075 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1075 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of

VGAM1075 correlate with, and may be deduced from, the identity of the host target genes which VGAM1075 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15015] Nucleotide sequences of the VGAM1075 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1075 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1075 are further described hereinbelow with reference to Table 1.

[15016] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1075 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15017] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1076 (VGAM1076) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[15018] VGAM1076 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1076 was detected is described hereinabove with reference to Figs. 2–8.

[15019] VGAM1076 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15020] VGAM1076 gene, herein designated VGAM GENE, encodes a VGAM1076 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1076 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1076 precursor RNA is designated SEQ ID:1062, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1062 is located at position 17488 relative to the genome of porcine epidemic diarrhea virus.

[15021] VGAM1076 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15022] An enzyme complex designated DICER COMPLEX, dices the VGAM1076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1076 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1076 RNA is designated SEQ ID:3787, and is provided hereinbelow with reference to the sequence listing part.

[15023] VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15024] VGAM1076 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1076 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1076 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15025] The complementary binding of VGAM1076 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1076 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15026] It is appreciated that VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1076 host target genes. The mRNA of each one of this plurality of VGAM1076 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1076 RNA, herein designated VGAM RNA, and which when bound by VGAM1076 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1076 host target proteins.

[15027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1076 gene, herein designated VGAM GENE, on one or more VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15028] It is yet further appreciated that a function of VGAM1076 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1076 include diagnosis, prevention and

treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1076 correlate with, and may be deduced from, the identity of the host target genes which VGAM1076 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15029] Nucleotide sequences of the VGAM1076 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1076 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1076 are further described hereinbelow with reference to Table 1.

[15030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1076 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15031] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1077 (VGAM1077) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15032] VGAM1077 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1077 was detected is described hereinabove with reference to Figs. 2–8.

[15033] VGAM1077 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1077 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15034] VGAM1077 gene, herein designated VGAM GENE, encodes a VGAM1077 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1077 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1077 precursor RNA is designated SEQ ID:1063, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1063 is located at position 1109 relative to the genome of porcine epidemic diarrhea virus.

[15035] VGAM1077 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15036] An enzyme complex designated DICER COMPLEX, dices the VGAM1077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1077 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1077 RNA is designated SEQ ID:3788, and is provided hereinbelow with reference to the sequence listing part.

[15037] VGAM1077 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15038] VGAM1077 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1077 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15039] The complementary binding of VGAM1077 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1077 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15040] It is appreciated that VGAM1077 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1077 host target genes. The mRNA of each one of this plurality of VGAM1077 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1077 RNA, herein designated VGAM

RNA, and which when bound by VGAM1077 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1077 host target proteins.

[15041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1077 gene, herein designated VGAM GENE, on one or more VGAM1077 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15042] It is yet further appreciated that a function of VGAM1077 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1077 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1077 correlate with, and may be deduced from, the identity of the host target genes which VGAM1077 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15043] Nucleotide sequences of the VGAM1077 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1077 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1077 are further described hereinbelow with reference to Table 1.

[15044] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1077 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15045] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1078 (VGAM1078) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15046] VGAM1078 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1078 was detected is described hereinabove with reference to Figs. 2-8.

[15047] VGAM1078 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15048] VGAM1078 gene, herein designated VGAM GENE, encodes a VGAM1078 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1078 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1078 precursor RNA is designated SEQ ID:1064, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1064 is located at position 1314

relative to the genome of porcine epidemic diarrhea virus.

[15049] VGAM1078 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15050] An enzyme complex designated DICER COMPLEX, dices the VGAM1078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1078 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1078 RNA is designated SEQ ID:3789, and is provided hereinbelow with reference to the sequence listing part.

[15051] VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15052] VGAM1078 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1078 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15053] The complementary binding of VGAM1078 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1078 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15054] It is appreciated that VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1078 host target genes. The mRNA of each one of this plurality of VGAM1078 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1078 RNA, herein designated VGAM RNA, and which when bound by VGAM1078 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1078 host target proteins.

[15055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1078 gene, herein designated VGAM GENE, on one or more VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15056] It is yet further appreciated that a function of VGAM1078 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1078 correlate with, and may be deduced from, the identity of the host target genes which VGAM1078 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15057] Nucleotide sequences of the VGAM1078 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1078 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1078 are further described hereinbelow with reference to Table 1.

[15058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1078 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15059] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1079 (VGAM1079) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15060] VGAM1079 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1079 was detected is described hereinabove with reference to Figs. 2–8.

[15061] VGAM1079 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15062] VGAM1079 gene, herein designated VGAM GENE, encodes a VGAM1079 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1079 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1079 precursor RNA is designated SEQ ID:1065, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1065 is located at position 5967 relative to the genome of porcine epidemic diarrhea virus.

[15063] VGAM1079 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15064] An enzyme complex designated DICER COMPLEX, dices the VGAM1079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1079 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1079 RNA is designated SEQ ID:3790, and is provided hereinbelow with reference to the sequence

listing part.

[15065] VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15066] VGAM1079 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1079 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1079 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15067] The complementary binding of VGAM1079 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1079 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15068] It is appreciated that VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1079 host target genes. The mRNA of each one of this plurality of VGAM1079 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1079 RNA, herein designated VGAM RNA, and which when bound by VGAM1079 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1079 host target proteins.

[15069] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1079 gene, herein designated VGAM GENE, on one or more VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15070] It is yet further appreciated that a function of VGAM1079

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1079 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1079 correlate with, and may be deduced from, the identity of the host target genes which VGAM1079 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15071] Nucleotide sequences of the VGAM1079 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1079 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1079 are further described hereinbelow with reference to Table 1.

[15072] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1079 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15073] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1080 (VGAM1080) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15074] VGAM1080 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1080 was detected is described hereinabove with reference to Figs. 2–8.

[15075] VGAM1080 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15076] VGAM1080 gene, herein designated VGAM GENE, encodes a VGAM1080 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1080 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1080 precursor RNA is designated SEQ ID:1066, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1066 is located at position 15169 relative to the genome of porcine epidemic diarrhoea virus.

[15077] VGAM1080 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15078] An enzyme complex designated DICER COMPLEX, dices the VGAM1080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1080 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide se-

quence of VGAM1080 RNA is designated SEQ ID:3791, and is provided hereinbelow with reference to the sequence listing part.

[15079] VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15080] VGAM1080 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1080 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15081] The complementary binding of VGAM1080 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1080 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15082] It is appreciated that VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1080 host target genes. The mRNA of

each one of this plurality of VGAM1080 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1080 RNA, herein designated VGAM RNA, and which when bound by VGAM1080 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1080 host target proteins.

[15083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1080 gene, herein designated VGAM GENE, on one or more VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[15084] It is yet further appreciated that a function of VGAM1080 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1080 correlate with, and may be deduced from, the identity of the host target genes which VGAM1080 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15085] Nucleotide sequences of the VGAM1080 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1080 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1080 are further described hereinbelow with reference to Table 1.

[15086] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1080 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[15087] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1081 (VGAM1081) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15088] VGAM1081 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1081 was detected is described hereinabove with reference to Figs. 2–8.

[15089] VGAM1081 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1081 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15090] VGAM1081 gene, herein designated VGAM GENE, encodes a VGAM1081 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1081 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1081 precursor RNA is designated SEQ ID:1067, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1067 is located at position 11817 relative to the genome of porcine epidemic diarrhea virus.

[15091] VGAM1081 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15092] An enzyme complex designated DICER COMPLEX, dices the VGAM1081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1081 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1081 RNA is designated SEQ ID:3792, and is provided hereinbelow with reference to the sequence listing part.

[15093] VGAM1081 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15094] VGAM1081 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1081 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15095] The complementary binding of VGAM1081 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1081 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15096] It is appreciated that VGAM1081 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1081 host target genes. The mRNA of each one of this plurality of VGAM1081 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1081 RNA, herein designated VGAM RNA, and which when bound by VGAM1081 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1081 host target proteins.

[15097] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1081 gene, herein designated VGAM GENE, on one or more VGAM1081 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15098] It is yet further appreciated that a function of VGAM1081 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1081 correlate with, and may be deduced from, the identity of the host target genes which VGAM1081 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15099] Nucleotide sequences of the VGAM1081 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1081 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1081 are further described hereinbelow with reference to Table 1.

[15100] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1081 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15101] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1082 (VGAM1082) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15102] VGAM1082 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1082 was detected is described hereinabove with reference to Figs. 2–8.

[15103] VGAM1082 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15104] VGAM1082 gene, herein designated VGAM GENE, encodes a VGAM1082 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1082 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1082 precursor RNA is designated SEQ ID:1068, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1068 is located at position 15710 relative to the genome of porcine epidemic diarrhea virus.

[15105] VGAM1082 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15106] An enzyme complex designated DICER COMPLEX, dices the VGAM1082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1082 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1082 RNA is designated SEQ ID:3793, and is provided hereinbelow with reference to the sequence listing part.

[15107] VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15108] VGAM1082 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1082 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1082 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15109] The complementary binding of VGAM1082 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1082 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[15110] It is appreciated that VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1082 host target genes. The mRNA of each one of this plurality of VGAM1082 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1082 RNA, herein designated VGAM RNA, and which when bound by VGAM1082 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1082 host target proteins.

[15111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1082 gene, herein designated VGAM GENE, on one or more VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15112] It is yet further appreciated that a function of VGAM1082 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1082 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1082 correlate with, and may be deduced from, the identity of the host target genes which VGAM1082 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15113] Nucleotide sequences of the VGAM1082 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1082 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1082 are further described hereinbelow with reference to Table 1.

[15114] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1082 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15115] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1083 (VGAM1083) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15116] VGAM1083 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1083 was detected is described hereinabove with reference to Figs. 2-8.

[15117] VGAM1083 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15118] VGAM1083 gene, herein designated VGAM GENE, encodes a VGAM1083 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1083 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1083 precursor RNA is designated SEQ ID:1069, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1069 is located at position 13354 relative to the genome of porcine epidemic diarrhea virus.

[15119] VGAM1083 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15120] An enzyme complex designated DICER COMPLEX, dices the VGAM1083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1083 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1083 RNA is designated SEQ ID:3794, and is provided hereinbelow with reference to the sequence listing part.

[15121] VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15122] VGAM1083 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1083 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15123] The complementary binding of VGAM1083 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1083 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1083 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15124] It is appreciated that VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1083 host target genes. The mRNA of each one of this plurality of VGAM1083 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1083 RNA, herein designated VGAM RNA, and which when bound by VGAM1083 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1083 host target proteins.

[15125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1083 gene, herein designated VGAM GENE, on one or more VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15126] It is yet further appreciated that a function of VGAM1083 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1083 correlate with, and may be deduced from, the identity of the host target genes which VGAM1083 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15127] Nucleotide sequences of the VGAM1083 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1083 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1083 are further

described hereinbelow with reference to Table 1.

[15128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1083 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15129] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1084 (VGAM1084) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15130] VGAM1084 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1084 was detected is described hereinabove with reference to Figs. 2-8.

[15131] VGAM1084 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15132] VGAM1084 gene, herein designated VGAM GENE, encodes a VGAM1084 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1084 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1084 precursor RNA is designated SEQ ID:1070, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1070 is located at position 11654 relative to the genome of porcine epidemic diarrhea virus.

[15133] VGAM1084 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15134] An enzyme complex designated DICER COMPLEX, dices

the VGAM1084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1084 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1084 RNA is designated SEQ ID:3795, and is provided hereinbelow with reference to the sequence listing part.

[15135] VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15136] VGAM1084 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1084 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1084 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15137] The complementary binding of VGAM1084 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1084 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15138] It is appreciated that VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1084 host target genes. The mRNA of each one of this plurality of VGAM1084 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1084 RNA, herein designated VGAM RNA, and which when bound by VGAM1084 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1084 host target proteins.

[15139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1084 gene, herein designated VGAM GENE, on one or more VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15140] It is yet further appreciated that a function of VGAM1084 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1084 correlate with, and may be deduced from, the identity of the host target genes which VGAM1084 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15141] Nucleotide sequences of the VGAM1084 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1084 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1084 are further described hereinbelow with reference to Table 1.

[15142] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1084 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15143] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1085 (VGAM1085) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15144] VGAM1085 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1085 was detected is described hereinabove with reference to Figs. 2-8.

[15145] VGAM1085 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhoea virus. VGAM1085 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15146] VGAM1085 gene, herein designated VGAM GENE, encodes a VGAM1085 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1085 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1085 precursor RNA is designated SEQ ID:1071, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1071 is located at position 14382 relative to the genome of porcine epidemic diarrhea virus.

[15147] VGAM1085 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[15148] An enzyme complex designated DICER COMPLEX, dices the VGAM1085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1085 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1085 RNA is designated SEQ ID:3796, and is provided hereinbelow with reference to the sequence listing part.

[15149] VGAM1085 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15150] VGAM1085 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1085 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1085 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15151] The complementary binding of VGAM1085 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1085 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15152] It is appreciated that VGAM1085 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1085 host target genes. The mRNA of each one of this plurality of VGAM1085 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1085 RNA, herein designated VGAM RNA, and which when bound by VGAM1085 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1085 host target proteins.

[15153] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1085 gene, herein designated VGAM GENE, on one or more VGAM1085 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15154] It is yet further appreciated that a function of VGAM1085 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1085 correlate with, and may be deduced from, the identity of the host target genes which VGAM1085 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15155] Nucleotide sequences of the VGAM1085 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1085 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1085 are further described hereinbelow with reference to Table 1.

[15156] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1085 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15157] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1086 (VGAM1086) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15158] VGAM1086 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1086 was detected is described hereinabove with reference to Figs. 2-8.

[15159] VGAM1086 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of porcine epidemic diarrhea virus. VGAM1086 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15160] VGAM1086 gene, herein designated VGAM GENE, encodes a VGAM1086 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1086 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1086 precursor RNA is designated SEQ ID:1072, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1072 is located at position 5568 relative to the genome of porcine epidemic diarrhea virus.

[15161] VGAM1086 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15162] An enzyme complex designated DICER COMPLEX, dices the VGAM1086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1086 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1086 RNA is designated SEQ ID:3797, and is provided hereinbelow with reference to the sequence listing part.

[15163] VGAM1086 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1086 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1086 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15164] VGAM1086 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1086 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1086 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1086 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15165] The complementary binding of VGAM1086 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1086 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1086 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1086 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15166] It is appreciated that VGAM1086 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1086 host target genes. The mRNA of each one of this plurality of VGAM1086 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1086 RNA, herein designated VGAM RNA, and which when bound by VGAM1086 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1086 host target proteins.

[15167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1086 gene, herein designated VGAM GENE, on one or more VGAM1086 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15168] It is yet further appreciated that a function of VGAM1086 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1086 correlate with, and may be deduced from, the identity of the host target genes which VGAM1086 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15169] Nucleotide sequences of the VGAM1086 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1086 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1086 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1086 are further described hereinbelow with reference to Table 1.

[15170] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1086 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15171] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1087 (VGAM1087) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15172] VGAM1087 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1087 was detected is described hereinabove with reference to Figs. 2-8.

[15173] VGAM1087 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15174] VGAM1087 gene, herein designated VGAM GENE, encodes a VGAM1087 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1087 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1087 precursor RNA is designated SEQ ID:1073, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1073 is located at position 5802 relative to the genome of porcine epidemic diarrhea virus.

[15175] VGAM1087 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15176] An enzyme complex designated DICER COMPLEX, dices the VGAM1087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1087 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1087 RNA is designated SEQ ID:3798, and is provided hereinbelow with reference to the sequence listing part.

[15177] VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[15178] VGAM1087 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1087 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15179] The complementary binding of VGAM1087 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1087 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15180] It is appreciated that VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1087 host target genes. The mRNA of each one of this plurality of VGAM1087 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1087 RNA, herein designated VGAM RNA, and which when bound by VGAM1087 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1087 host target proteins.

[15181] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1087 gene, herein designated VGAM GENE, on one

or more VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15182] It is yet further appreciated that a function of VGAM1087 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1087 correlate with, and may be deduced from, the identity of the host target genes which VGAM1087 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15183] Nucleotide sequences of the VGAM1087 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1087 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1087 are further described hereinbelow with reference to Table 1.

[15184] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1087 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15185] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1088 (VGAM1088) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15186] VGAM1088 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1088 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[15187] VGAM1088 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15188] VGAM1088 gene, herein designated VGAM GENE, encodes a VGAM1088 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1088 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1088 precursor RNA is designated SEQ ID:1074, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1074 is located at position 1913 relative to the genome of porcine epidemic diarrhea virus.

[15189] VGAM1088 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15190] An enzyme complex designated DICER COMPLEX, dices the VGAM1088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1088 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1088 RNA is designated SEQ ID:3799, and is provided hereinbelow with reference to the sequence listing part.

[15191] VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15192] VGAM1088 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1088 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1088 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[15193] The complementary binding of VGAM1088 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1088 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15194] It is appreciated that VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1088 host target genes. The mRNA of each one of this plurality of VGAM1088 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1088 RNA, herein designated VGAM RNA, and which when bound by VGAM1088 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1088 host target proteins.

[15195] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1088 gene, herein designated VGAM GENE, on one or more VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15196] It is yet further appreciated that a function of VGAM1088 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1088 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1088 correlate with, and may be deduced from, the identity of the host target genes which VGAM1088 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[15197] Nucleotide sequences of the VGAM1088 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1088 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1088 are further described hereinbelow with reference to Table 1.

[15198] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1088 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15199] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1089 (VGAM1089) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15200] VGAM1089 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1089 was detected is described hereinabove with reference to Figs. 2–8.

[15201] VGAM1089 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15202] VGAM1089 gene, herein designated VGAM GENE, encodes a VGAM1089 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1089 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1089 precursor RNA is designated SEQ ID:1075, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1075 is located at position 3305 relative to the genome of porcine epidemic diarrhea virus.

[15203] VGAM1089 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15204] An enzyme complex designated DICER COMPLEX, dices the VGAM1089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1089 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1089 RNA is designated SEQ ID:3800, and is provided hereinbelow with reference to the sequence listing part.

[15205] VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15206] VGAM1089 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1089 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15207] The complementary binding of VGAM1089 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1089 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15208] It is appreciated that VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1089 host target genes. The mRNA of each one of this plurality of VGAM1089 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1089 RNA, herein designated VGAM RNA, and which when bound by VGAM1089 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1089 host target proteins.

[15209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1089 gene, herein designated VGAM GENE, on one or more VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15210] It is yet further appreciated that a function of VGAM1089 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1089 correlate with, and may be deduced from, the identity of the host target genes which VGAM1089 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15211] Nucleotide sequences of the VGAM1089 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1089 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1089 are further described hereinbelow with reference to Table 1.

[15212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1089 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15213] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1090 (VGAM1090) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15214] VGAM1090 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1090 was detected is described hereinabove with reference to Figs. 2–8.

[15215] VGAM1090 gene, herein designated VGAM GENE, is a viral gene contained in the genome of porcine epidemic diarrhea virus. VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15216] VGAM1090 gene, herein designated VGAM GENE, encodes a VGAM1090 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1090 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1090 precursor RNA is designated SEQ ID:1076, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1076 is located at position 2399 relative to the genome of porcine epidemic diarrhea virus.

[15217] VGAM1090 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15218] An enzyme complex designated DICER COMPLEX, dices the VGAM1090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1090 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1090 RNA is designated SEQ ID:3801, and is provided hereinbelow with reference to the sequence listing part.

[15219] VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15220] VGAM1090 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1090 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15221] The complementary binding of VGAM1090 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1090 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15222] It is appreciated that VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1090 host target genes. The mRNA of each one of this plurality of VGAM1090 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1090 RNA, herein designated VGAM RNA, and which when bound by VGAM1090 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1090 host target proteins.

[15223] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1090 gene, herein designated VGAM GENE, on one or more VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15224] It is yet further appreciated that a function of VGAM1090 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of viral infection by porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM1090 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1090 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15225] Nucleotide sequences of the VGAM1090 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1090 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1090 are further described hereinbelow with reference to Table 1.

[15226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1090 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15227] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1091 (VGAM1091) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15228] VGAM1091 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1091 was detected is described hereinabove with reference to Figs. 2-8.

[15229] VGAM1091 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia mosaic virus. VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15230] VGAM1091 gene, herein designated VGAM GENE, encodes a VGAM1091 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1091 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1091 precursor RNA is designated SEQ ID:1077, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1077 is located at position 854 relative to the genome of Poinsettia mosaic virus.

[15231] VGAM1091 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1091 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15232] An enzyme complex designated DICER COMPLEX, dices the VGAM1091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1091 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1091 RNA is designated SEQ ID:3802, and is provided hereinbelow with reference to the sequence listing part.

[15233] VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1091 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15234] VGAM1091 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1091 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1091 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15235] The complementary binding of VGAM1091 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1091 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15236] It is appreciated that VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1091 host target genes. The mRNA of each one of this plurality of VGAM1091 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1091 RNA, herein designated VGAM RNA, and which when bound by VGAM1091 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1091 host target proteins.

[15237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1091 gene, herein designated VGAM GENE, on one or more VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15238] It is yet further appreciated that a function of VGAM1091 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1091 include diagnosis, prevention and treatment of viral infection by Poinsettia mosaic virus. Specific functions, and accordingly utilities, of VGAM1091

correlate with, and may be deduced from, the identity of the host target genes which VGAM1091 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15239] Nucleotide sequences of the VGAM1091 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1091 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1091 are further described hereinbelow with reference to Table 1.

[15240] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1091 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15241] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1092 (VGAM1092) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[15242] VGAM1092 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1092 was detected is described hereinabove with reference to Figs. 2–8.

[15243] VGAM1092 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia mosaic virus. VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15244] VGAM1092 gene, herein designated VGAM GENE, encodes a VGAM1092 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1092 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1092 precursor RNA is designated SEQ ID:1078, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1078 is located at position 92 relative to the genome of Poinsettia mosaic virus.

[15245] VGAM1092 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1092 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15246] An enzyme complex designated DICER COMPLEX, dices the VGAM1092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1092 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1092 RNA is designated SEQ ID:3803, and is provided hereinbelow with reference to the sequence listing part.

[15247] VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1092 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15248] VGAM1092 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1092 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1092 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15249] The complementary binding of VGAM1092 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1092 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15250] It is appreciated that VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1092 host target genes. The mRNA of each one of this plurality of VGAM1092 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1092 RNA, herein designated VGAM RNA, and which when bound by VGAM1092 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1092 host target proteins.

[15251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1092 gene, herein designated VGAM GENE, on one or more VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15252] It is yet further appreciated that a function of VGAM1092 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1092 include diagnosis, prevention and treatment of viral infection by Poinsettia mosaic virus.

Specific functions, and accordingly utilities, of VGAM1092 correlate with, and may be deduced from, the identity of the host target genes which VGAM1092 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15253] Nucleotide sequences of the VGAM1092 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1092 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1092 are further described hereinbelow with reference to Table 1.

[15254] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1092 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15255] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1093 (VGAM1093) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[15256] VGAM1093 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1093 was detected is described hereinabove with reference to Figs. 2–8.

[15257] VGAM1093 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia mosaic virus. VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15258] VGAM1093 gene, herein designated VGAM GENE, encodes a VGAM1093 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1093 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1093 precursor RNA is designated SEQ ID:1079, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1079 is located at position 3299 relative to the genome of Poinsettia mosaic virus.

[15259] VGAM1093 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15260] An enzyme complex designated DICER COMPLEX, dices the VGAM1093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1093 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1093 RNA is designated SEQ ID:3804, and is provided hereinbelow with reference to the sequence listing part.

[15261] VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15262] VGAM1093 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1093 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1093 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15263] The complementary binding of VGAM1093 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1093 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15264] It is appreciated that VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1093 host target genes. The mRNA of each one of this plurality of VGAM1093 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1093 RNA, herein designated VGAM RNA, and which when bound by VGAM1093 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1093 host target proteins.

[15265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1093 gene, herein designated VGAM GENE, on one or more VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15266] It is yet further appreciated that a function of VGAM1093 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1093 include diagnosis, prevention and

treatment of viral infection by Poinsettia mosaic virus. Specific functions, and accordingly utilities, of VGAM1093 correlate with, and may be deduced from, the identity of the host target genes which VGAM1093 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15267] Nucleotide sequences of the VGAM1093 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1093 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1093 are further described hereinbelow with reference to Table 1.

[15268] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1093 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15269] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1094 (VGAM1094) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15270] VGAM1094 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1094 was detected is described hereinabove with reference to Figs. 2–8.

[15271] VGAM1094 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia mosaic virus. VGAM1094 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15272] VGAM1094 gene, herein designated VGAM GENE, encodes a VGAM1094 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1094 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1094 precursor RNA is designated SEQ ID:1080, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1080 is located at position 5436 relative to the genome of Poinsettia mosaic virus.

[15273] VGAM1094 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15274] An enzyme complex designated DICER COMPLEX, dices the VGAM1094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1094 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1094 RNA is designated SEQ ID:3805, and is provided hereinbelow with reference to the sequence listing part.

[15275] VGAM1094 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15276] VGAM1094 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1094 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1094 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15277] The complementary binding of VGAM1094 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1094 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15278] It is appreciated that VGAM1094 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1094 host target genes. The mRNA of each one of this plurality of VGAM1094 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1094 RNA, herein designated VGAM

RNA, and which when bound by VGAM1094 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1094 host target proteins.

[15279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1094 gene, herein designated VGAM GENE, on one or more VGAM1094 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15280] It is yet further appreciated that a function of VGAM1094 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1094 include diagnosis, prevention and treatment of viral infection by Poinsettia mosaic virus. Specific functions, and accordingly utilities, of VGAM1094 correlate with, and may be deduced from, the identity of the host target genes which VGAM1094 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15281] Nucleotide sequences of the VGAM1094 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1094 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1094 are further described hereinbelow with reference to Table 1.

[15282] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1094 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15283] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1095 (VGAM1095) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15284] VGAM1095 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1095 was detected is described hereinabove with reference to Figs. 2-8.

[15285] VGAM1095 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia mosaic virus. VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15286] VGAM1095 gene, herein designated VGAM GENE, encodes a VGAM1095 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1095 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1095 precursor RNA is designated SEQ ID:1081, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1081 is located at position 973

relative to the genome of Poinsettia mosaic virus.

[15287] VGAM1095 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15288] An enzyme complex designated DICER COMPLEX, dices the VGAM1095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1095 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1095 RNA is designated SEQ ID:3806, and is provided hereinbelow with reference to the sequence listing part.

[15289] VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15290] VGAM1095 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1095 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1095 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15291] The complementary binding of VGAM1095 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1095 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15292] It is appreciated that VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1095 host target genes. The mRNA of each one of this plurality of VGAM1095 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1095 RNA, herein designated VGAM RNA, and which when bound by VGAM1095 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1095 host target proteins.

[15293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1095 gene, herein designated VGAM GENE, on one or more VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15294] It is yet further appreciated that a function of VGAM1095 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1095 include diagnosis, prevention and treatment of viral infection by Poinsettia mosaic virus. Specific functions, and accordingly utilities, of VGAM1095 correlate with, and may be deduced from, the identity of the host target genes which VGAM1095 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15295] Nucleotide sequences of the VGAM1095 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1095 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1095 are further described hereinbelow with reference to Table 1.

[15296] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1095 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15297] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present
